Project Preparation Consultancy Services for Preparing Detailed Project Report (DPR) for Various Road Improvement Works Under Tamil Nadu Road Sector Project II (TNRSP II) – Contract PPC 03

Volume VII Part I ENVIRONMENTAL IMPACT ASSESSMENT REPORT FOR PHASE-I ROADS

- □ Thiruchengode Paramathy Section of Road No. 2 (SH 86)
- Malliyakarai Rasipuram & Rasipuram Thiruchengode Sections of Road No. 4 (SH 79)
- □ Mohanur Namakkal Section of Road No. 5 (SH- 95)

September 2014

Abbreviations

AADT	Annual Average Daily Traffic
AMSL	Above Mean Sea Level

Executive Summary

E.1. Background

Government of Tamil Nadu (GoTN) has decided to improve the State Highways in the State of Tamil Nadu with financial assistance from the World Bank under the Tamil Nadu Road Sector Project (TNRSP). The GoTN has now taken up the up-gradation, maintenance and improvement of selected roads under TNRSP-II program. Roads considered under TNRSP II are divided in to five Packages i.e., PPC01, PPC02, PPC03, PPC04 and PPC05. M/s CDM Smith India Private Limited has been entrusted by GoTN for the task of carrying out the Feasibility Studies and preparation of Detailed Project Report including Environmental and Social Impact Assessment for upgradation, maintenance and improvement of road network under package PPC03. Package PPC03 consists of 7 project roads of total length 421.44 Km. Out of these seven roads, four sections of three roads are selected as Phase-I roads under TNRSP-II, which will be implemented immediately. Details of the Phase-I roads under TNRSP-II are presented in **Table E.1**.

Road No.	Project Road	Phase-I Road Sections	Starting	Ending	Length in Km
2	Omalur - Sankari - Tiruchengode - Paramathy road (Km 45+200 to Km 81+000 of SH86)	Thiruchengode - Paramathy Section	Meenkinaru near Tiruchengode at Km 54+800 where proposed Tiruchengode bypass intersects SH 86	Paramathy at Km 80+100	26.2
4	Malliyakarai - Rasipuram - Tiruchengode - Erode Road (Km 0+000 to Km 94+660 of SH79)	Section I: Malliyakarai – Rasipuram Section	Malliyakarai at Km 0+000 where SH79 intersects SH30 (Km 81+000)	Near Namagiripettai at Km 30+600 where proposed Rasipuram bypass starts	30.6
		Section II: Rasipuram - Thiruchengode Section	Ponkurichi at Km 51+400 where proposed Rasipuram bypass ends	Mettupalayam at Km 71+280 where proposed Tiruchengode bypass starts	19.9
5	Mohanur – Namakkal – Senthamangalam - Rasipuram Road (Km 0+000 to Km 54+000 of SH95)	Mohanur – Namakkal Section	Mohanur town at RUB of Velur- Mohanur Road MDR 547 (Km 15+800)	Laddiwadi at Km 13+300 where proposed Namakkal Outer Ring Road intersects SH95	13.35

Table E.1.	Details of Phase-I Roads under TNRSP-II under PPC03
Table E.I.	Details of Fliase-1 Roads under TNRSF-11 under FFC05

E.2. Objective of the Assignment

The main objective of the project is to alleviate the current unsafe and congested conditions of the road network connecting the villages and towns by providing better quality and safe roads to the users in a sustainable and environment friendly manner. The major objectives of this study are stated below:

- To present to decision makers a clear assessment of potential impact associated with the proposed project intervention,
- To apply a methodology which assesses and predict potential impacts and provides a) the means for impact prevention and mitigation, b) the enhancement of project benefits, and c) the minimization of long-term impacts;
- To provide a specific forum in which consultation is systematically undertaken in a manner that allows stakeholders to have direct input to the environmental management process.
- To assess the analysis of alternatives to bring environmental considerations into the upstream stages of development planning as well as the later stage of site selection, design and implementation, and
- To recommend the environmental management measures to reduce adverse impacts.

E.3. Scope of Environmental Assessment

The environmental assessment scope includes screening and scoping, environmental assessment and environmental management plans for the individual project roads as required. The EA process also envisages developing a comprehensive environmental management framework for the entire project, which will be adopted as part of the environmental policy for Tamil Nadu Road Sector Project-II.

E.4. Description of Project Roads

Out of seven roads, three roads are considered as Phase-I roads under TNRSP-II, which will be implemented by project proponent on priority. Details of Phase-I roads under TNRSP-II under PPC03 are presented in **Table E.1**. The project envisages the improvements of Phase-I roads under TNRSP-II from existing two lane with earthen shoulder to two lane with paved shoulder configuration based on the lane requirements, type of land use and terrain and availability of land & maximum utilization of existing pavement. Based on the traffic assessment report and available RoW, TNRSP has formulated eight typical cross sections without compromising the provisions of Manual and terms of reference (ToR). The proposed improvement includes the widening of the project roads as per the traffic warrants, strengthening / reconstruction of the existing pavement for the entire length, provision of footpath cum drain at built-up locations, improvement / redesign of sharp curves, widening / reconstruction of bus shelters, and shifting of utilities. There are total ten minor realignments proposed for the Phase-I roads under TNRSP-II to overcome the geometric deficiency and to attain the desired design speed. No bypass requirement is envisaged for the Phase-I roads under

TNRSP-II since GoTN has considered bypasses for major built-ups (except for Tiruchengode), along the Phase-I roads under TNRSP-II under a separate scheme with NABARD financial assistance. The bypass for Tiruchengode is proposed to be taken up along with Phase-II roads under TNRSP II.

E.5. Key Environmental Laws and Regulations

Table E.2 presents the environmental regulations and legislations relevant to project roads.

Sl.	Type of	Statutory	Applicability	Project	Time	Responsibility

E.6. Baseline Environment

Data was collected from secondary sources for the macro-environmental setting like climate, physiography (Geology and slope), biological and socio-economic environment within Project Influence Area (PIA) / Project Districts. Firsthand information has been collected to record the micro-environmental features within Corridor of Impact (CoI). Collection of first hand (Primary) information includes preparation of base maps, extrapolating environmental features on proposed road design, tree enumeration, location and measurement of socio-cultural features abutting project road.

E.7. Stakeholder Consultation

Considering the fact that involving local communities in the project planning is basis of the participatory planning, stakeholder consultations at various levels were conducted during different stages of the project. Suggestions and options given by the people improves technical and economic efficiency of the project and suggested improvement proposals of the people (if adopted by the project) also generates sense of ownership within communities thus eases implementation process. Stakeholder consultations conducted for the project comprised one-to-one interviews, focus group discussions and structured public consultation meetings. The stake holder consultations were conducted before project design and after project design. The suggestions obtained during pre-design consultation were considered in the project design. The designs were further modified based on the suggestions obtained during post-design consultations.

E.8. Information Dissemination

- The consultant has conducted information dissemination by one to one campaigning about proposed improvement.
- Potential project affected families were consulted to inform them about proposed road improvement program and possible environmental conflict such as tree cutting, relocation of utilities.
- Structured consultation was conducted at hot spots along the project corridors for information dissemination and collecting the opinion / suggestion from the public.
- Pictorial Methods were adopted to explain proposed improvement and possible environmental impacts in the concerned villages.

E.9. Analysis of Alternatives

It is customary to include a 'No Action alternative' in order to confirm that the project upgradation is a requirement of the people of Tamil Nadu and hence need to be implemented. The project roads are important highway for the overall development of the State. The 'no action alternative' will not allow any of these improvements therefore cannot be acceptable to the local people.

The 'no action alternative' will not resolve this issue; on the other hand, due to the standard improvements to the project road it is most likely that the project road will serve as a much safer road for the commuters. Considering the land use, environmental features, road geometry etc., optimum levels of improvements have been proposed for the project roads.

Realignments have been considered at ten locations along the project roads where geometric deficiencies occur.

E.10. Potential Impacts

E.10.1. Potential Negative Impacts of the Project during Construction Phase

The activities during the construction phase of the project road includes leveling of site, clearing of trees along the alignment, widening of existing road with paved shoulders, construction of culverts and bridges, and quarry operations for the road work. Some of the potential direct and indirect negative impacts of the project during construction phase will be the following.

- Filling in low-lying areas for embankments of the road.
- Cutting of trees.
- Loss of topsoil due to clearing and grubbing of vegetation for new alignment, borrow area and quarry operation, construction camps and material stacking yard.
- No considerable impacts on flora and fauna due to the construction activities.
- Temporary impact on the drainage pattern due to embankment, culvert and bridge constructions.
- No considerable Impact on traffic management system will happen.
- Increased air pollution (including dust) only during project road construction.
- Increased noise levels due to the movement of construction vehicles and construction activities.
- Bare minimum soil erosion leading to loss of top soil and pollution of surface water bodies.
- Spillage of oils and other hazardous materials may lead to pollution of surface and sub-surface waters depending upon the quantity of spillage.
- No considerable Pollution of rivers and canals due to construction of bridges and culverts.

E.10.2. Potential Negative Impacts of the Project during Operation Phase

During the operational phase of the project, traffic in the project road and the average speed of vehicles will increase. Some of the potential direct and indirect negative impacts of the project during operation phase are the following.

- Increased noise pollution along the project roads if the traffic volume increases and if the vehicles moves at a speed more than the prescribed speed
- Minimum Impact on natural drainage pattern of the project area
- Pollution of water bodies and impacts on its ecosystem if hazardous chemical or oil spill into the canals and streams

E.10.3. Potential Positive Impacts of the Project

The positive impacts of the project are:

- Reduction in air pollution and accidents along the project roads due to reduction in traffic congestion and smooth vehicular movement due to widening of the roads and provision of parking areas.
- Reduction in fuel consumption and travel time due to better service level of roads
- Improved safe and efficient connectivity between the project districts.
- Generation of local employment during road construction
- Improvement of local economy and industry due to better infrastructure facilities

E.10.4. Cumulative Environmental Impact of the Project

The overall effects caused by the sum of past, present and foreseeable future actions of the current project in combination with the actions of other projects are assessed. Differnent projects that are proposed or ongoing in the project region are identified and an attempt is made to asses the cumulative impacts of these projects on traffic, road safety and valued ecosystem components.

The programme for all the identified projects is not currently known, so it is not possible to predict the level of disruption that may occur. However, if all these projects occur simultaneously, there could be significant cumulative impact. Though it is very unlikely that all the projects will take off at a time, never the less the contractor should be aware of other project activities in the region and plan his activities in a way to reduce impact. Traffic management measures and environmental impact mitigation measures proposed in Chapter 8 of this document and also in EMP will ensure effects are insignificant.

E.11. Avoidance, Minimization, Mitigation & Enhancement

Prevention or avoidance of impact is better than mitigation of impact. Hence, avoidance and reduction of adverse impacts approaches were adopted during the design stage through continued interaction between the design and environmental teams. This is reflected in the designs of the horizontal & vertical alignment, cross sections adopted, construction methods and construction materials. In-depth site investigations have been carried out so that sensitive environmental resources are effectively avoided, leading to the environmentally best-fit alignment option.

E.12. Environmental Management Action Plan

Environmental Management Action Plan (EMAP) deals with the implementation procedure of the guidelines and measures recommended to avoid, minimize and mitigate environmental impacts of the

project. It also includes management measures suggested for enhancement of the environmental quality along the highways.

The institutional arrangement made under project will look into the implementation of project as well as EMAP and the various legal settings applicable to the project are briefly stated in **Chapter 3**.

The avoidance, mitigation & enhancement measures for protection of the environment along highways have been discussed. Although the social environmental impacts, its mitigation and management are essential component of the EMAP, this report excludes it for the purpose of clarity and procedural requirements. Social environmental elements have been separately dealt in separate volume namely, Resettlement and Rehabilitation Action Plan (RAP).

E.12.1. Objective of EMAP

The EMAP is a plan of action for mitigation / management / avoidance of the negative impacts of the project and enhancement of the project corridor. For each measure to be taken, its location, timeframe, implementation and overseeing / supervision responsibilities are listed. These components of the EMAP have been given in separate EMP Reports for each project road which explains the environmental issues and the avoidance/ mitigation/ minimization or enhancement measures adopted and/or to be adopted during different phases of the project. It also provides the references for the suggested measures, responsible agency for its implementation / management as well as its timeframe.

E.12.2. Cost Estimates for Environmental Management

Mitigation measures proposed in the EMAP will be implemented by the Contractor. The works to be undertaken by the Contractor have been quantified and the quantities included in the respective BOQ items such as earth works, slope protection, noise barriers, road safety features, and tree plantation.

Provisional quantities have also been included for additional measures that may be identified during construction and for silt fencing which will depend on the Contractors work methods and site locations. Items and quantities have also been included for enhancement measures.

More general environmental management measures to be followed by the contractor have been included in the specifications and the EMAP. These cannot be quantified and are to be included in the contract rates. The budget for the environmental management for the Phase-I roads under TNRSP-II is summarized in **Table E.3**.

Sl	Name of the Road Section	EMP Cost in Rs.			
No		For TNRSP	For Contractor		
1	Tiruchengode to Paramathy Section of Road No. 2 (SH 86)	27,88,000	3,23,87,372		
2	Malliyakarai to Rasipuram Section of Road No. 4 (SH 79)	27,88,000	4,33,12,249		
3	Rasipuram to Tiruchengode Section of Road No. 4 (SH 79)	27,88,000	2,99,89,076		
4	Mohanur to Namakkal Section of Road No. 5 (SH 95)	27,88,000	2,52,94,558		

 Table E.3.
 Summary of Environmental Management Cost for Phase-I Roads under PPC03

E.12.3. Organizational Framework

The proposed project will be implemented by TNRSP through its Environmental Management Unit (EMU). The EMU comprises of officers from Department of Forest, GoTN, and other Environmental Engineers. The EMU will be coordinating with the field level implementing agencies such as

Engineer (Supervision Consultant), Contractor and field level Highways Department (HD) officials. Role and responsibilities of important officials are detailed in the EMP Report.

Chapter 1. Introduction

1.1. Background

Government of Tamil Nadu (GoTN), on behalf of TNRSP has decided to improve the roads of around 2,050 Km in the State of Tamil Nadu. Under Tamil Nadu Road Sector Project Phase-I (TNRSP-I), World Bank assisted Project. GoTN has improved the State Highways for a length of about 1,800 Km under various improvement programs such as upgradation, enhanced periodical maintenance, performance based maintenance and Public Private Partnership on pilot basis was also taken up.

GoTN has now mooted a second phase of works namely Tamil Nadu Road Sector Project-II (TNRSP-II). The TNRSP-II is expected to cover upgradation, maintenance and improvement of the identified core road network and the project is divided into 5 packages namely PPC01, PPC02, PPC03, PPC04 and PPC05. The improvement mechanism consists of widening and strengthening of existing two lane carriageway to two lane with paved shoulder/ four lane or six lane depending upon the traffic assessment and pavement strengthening along with drainage facility, road furniture and accessories. In some cases new alignments and/or re-alignments would be required.

Keeping in view the objective of such an exercise, TNRSP commissioned M/s CDM Smith India Private Limited, Bangalore to undertake the study of road network under package PPC03 as an endeavour to dwell upon appropriate technologies and bring in sophistication in the approach to this Study. The task of study involves carrying out the Feasibility Studies, Environmental and Social Impact Assessment including preparation of Detailed Project Report for upgradation, maintenance and improvement. Corridors under package PPC03 as per the Contract Agreement are given in **Table 1.1** and the Location map is depicted in **Figure 1.1**.

Road	Project Road	Length in
No.		Km
1.	Omalur - Sankari- Tiruchengode - Paramathy road (Km 0/000 to Km 45/200 of SH86	46.00
2.	Omalur - Sankari - Tiruchengode - Paramathy road (Km 45/200 to Km 81/000 of SH86)	34.90
3.	Omalur - Mecheri Road (Km 0/000 to Km 14/600 of MDR: M307)	14.60
4.	Malliyakarai - Rasipuram - Tiruchengode - Erode Road (Km 0/000 to Km 94/660 of SH79)	96.06
5.	Mohanur – Namakkal – Senthamangalam - Rasipuram Road (Km 0/000 to Km 54/000 of SH95)	54.00
6.	Thoppur - Mettur - Bhavani - Erode Road (Km 0/000 to Km 93/980 of SH20)	93.98
7.	Trichy - Namakkal Road (Km 0/000 to Km 77/400 of SH25)	81.90
Total Le	ength of the PPC03 Project Roads in Km	421.44

1.2. The Project

1.2.1. Project Description

Out of seven roads in PPC03, four sections of three roads are considered as Phase-I roads under TNRSP-II. Details of road sections selected as Phase-I roads under TNRSP-II program are given in **Table 1.2**.

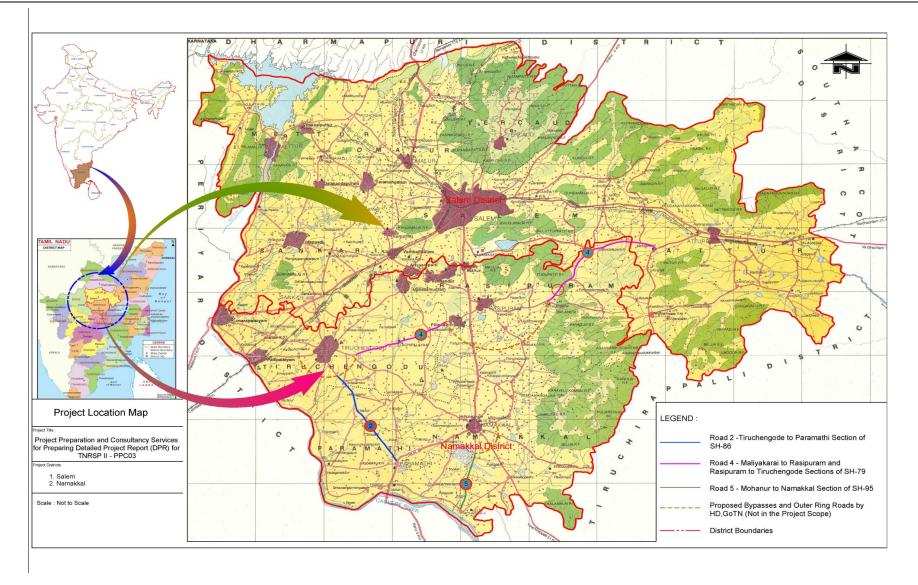

Road No.	Project Road	Phase-I Road Sections	Starting	Ending	Length in Km
2	Omalur - Sankari - Tiruchengode - Paramathy road (Km 45+200 to Km 81+000 of SH86)	Thiruchengode - Paramathy Section	Meenkinar near Thiruchengode at Km 54+800 where proposed Thiruchengode bypass intersects SH 86	Paramathy at Km 81+000	26.2
4	Malliyakarai - Rasipuram - Tiruchengode - Erode Road (Km 0+000 to Km 94+660 of SH79)	Section I: Malliyakarai – Rasipuram Section	Malliyakarai at 0+000 where SH79 intersects SH30 (Km 81+000)	Near Namagiripettai at Km 30+600 where proposed Rasipuram bypass starts	30.6
		Section II: Rasipuram - Thiruchengode Section	Ponkurichi at Km 51+400 where proposed Rasipuram bypass ends	Mettupalayam at Km 71+280 where proposed Thiruchengode bypass starts	19.9
5	Mohanur – Namakkal – Senthamangalam - Rasipuram Road (Km 0+000 to Km 54+000 of SH95)	Mohanur – Namakkal Section	Mohanur town at RUB of Velur - Mohanur Road (MDR 547) at Km 15+650	Ladiwadi at Km 13+300 where proposed Namakkal Outer Ring Road intersects SH95	13.35

 Table 1.2.
 Details of Phase-I Roads under TNRSP-II under PPC03

The present report on Environmental Impact Assessment (EIA) deals with the environmental analysis of Phase-I roads under TNRSP-II in accordance with World Bank's guidelines on Environmental Assessment. **Figure 1.1** shows the location of project roads.

1.2.2. Objectives of the Assignment

Surface transport plays a vital role in the transportation of goods and agricultural products in this State. To achieve the Government's development objectives, the existing road infrastructure urgently requires improvement. The main objective of the project would be to alleviate the current unsafe and congested conditions of the road network connecting the villages and towns by providing better quality and safe roads to the users in a sustainable and environment friendly manner.

This report is prepared in accordance with the World Bank's operational policies guidelines on Environmental Assessment and to meet the statutory requirement of Ministry of Environment, Forests and Climate Change (MoEF&CC). The major objectives of this study are stated below:

- To present to decision makers a clear assessment of potential impact associated with the proposed project intervention,
- To apply a methodology which assesses and predict potential impacts and provides a) the means for impact prevention and mitigation, b) the enhancement of project benefits, and c) the minimization of long-term impacts;
- To provide a specific forum in which consultation is systematically undertaken in a manner that allows stakeholders to have direct input to the environmental management process.
- To assess the analysis of alternatives to bring environmental considerations into the upstream stages of development planning as well as the later stage of site selection, design and implementation, and
- To recommend the environmental management measures to reduce adverse impacts.

In order to achieve these objectives, detailed surveys and other studies have been carried out along the project roads to identify Valued Environmental Components (VEC) and corridor specific significant environmental issues (SEI). For investigation/monitoring purpose the study area has been defined as,

- Corridor of Impact (CoI): is the proposed Right of Way (RoW).
- **Project Influence Area (PIA):** PIA is the 10 Km area on either side along the alignment. Topographical and Google Map showing Project Influence Area for TNRSP-II Phase-I roads is shown in **Annexure 1.1.**
- **Project District (PD):** is/are the district/districts through which project road is passing.

1.2.3. Scope of Environmental Assessment

The environmental assessment scope includes screening and scoping, environmental assessment and environmental management plans for the individual project roads as required. The EA process also envisages to develop a comprehensive environmental management framework for the entire project, which will be adopted as part of the environmental policy for Tamil Nadu Road Sector Project-II.

Environmental Screening and Scoping

Environmental screening exercise of the project roads were undertaken to facilitate inputs on environmental considerations, apart from social, economic, and traffic & transport considerations to evaluate the adverse environmental impacts of each project corridor. Further, this report also provides scoping inputs in determining the major environmental issues and defines the scope of work for conducting environmental assessment. As per the recommendation of the Environmental Screening report, detailed Environmental Assessment has been carried out for the project roads. The scoping exercise defines geographical boundaries for the project roads for impact assessment as well as defining the project influence area to assess the impacts due to project activities.

Environmental Assessment

The EA for project roads includes establishing environmental baseline in the study area, conducting organized stakeholder consultation, identify the range of environmental impacts, specify the measures to avoid, minimize, and mitigate negative impacts and maximize positive impacts and integrate possible environmental enhancement measures. The proposed measures will be formulated in the form of an environmental management plan with necessary budget and institutional roles for effective implementation. Separate EMPs have to be prepared for individual project roads and integrated in to project implementation agreements, including construction contract documents.

Environmental Management Framework

An Environmental Management Framework will be designed for the implementation of the project. The environmental management framework shall consists of overall framework which will be developed as a guidance document providing environmental planning and design criteria for of the current as well as future project roads, generic environmental management measures, institutional mechanism for implementation, capacity building and training process, and resource material to function adequately to mainstream the environmental management.

1.2.4. Project Benefits

The main objective of the project is to provide safe and efficient service levels to growing traffic movements and better connectivity to the region. All road users will be benefited from the proposed improvement on account of comfort, safety and reduced vehicle operating costs. Development of the project road will help the local farmers and businessmen to trade their commodities to nearby cities/towns. Due to better infrastructure reputed educational institutes will look forward to establish in the project influence area, resulting in better education for the local inhabitants.

With the advent of better two lane highway, the vehicle operating and maintenance cost is expected to go down substantially. The proposed road alignment will also include general amenities like bus bays, landscaping and tree plantation, traffic aid post, emergency medical aid post, street light at built-ups etc. and thus overall facilities to the road users shall improve.

A significant economic benefit of the improvement project is generation of employment opportunities during the construction activities, which will be available to the people, including affected community. Besides, they will also draw benefits from the economic activities as a result of increased traffic flow and movement of vehicles. The project road will help in the economic upliftment of the entire region.

Namakkal district is emerging as new destination for dyeing industries, since the High Court of Tamil Nadu had issued closure order to dyeing industries located in Tirupur district two years ago, as they violated the pollution norms stipulated by CPCB. Improvement of selected corridors may attract more industries in the project region. Decadal growth rate of population in Namakkal district has increased from 12.90% in 1991-2001 to 15.61% in 2001-2011. The decadal population growth in 2001-2011 is higher compared to Tamil Nadu (15.60%) as well as neighboring districts i.e., Salem (15.43%) and Erode (11.66%). **Table 1.4** presents decadal population growth of Namakkal, Salem and Erode Districts and Tamil Nadu State.

	Population			Decadal Growth	Decadal Growth
Name	1991	2001	2011	1991- 2001 in %	2001 -2011 in %
Tamil Nadu	5,58,58,946	62405679	72147030	11.72011552	15.60971879
Namakkal	13,22,715	1493462	1726601	12.90882768	15.61064158

The above table shows that, Tamil Nadu is second highest in NSDP and PCI and it has got more potential in overall economic growth in south India.

1.2.5. Structure of the Report

The EIA is organized in accordance with the stipulation of the Environmental Impact Assessment Notification 2006, World Bank Operational Policy 4.01 and the recommendation from World Bank Technical Paper Number 376: *Roads and Environment: A Handbook*. Accordingly the entire document is organized in two parts.

Environmental Impact Assessment (EIA) for the TNRSP-II Phase-I roads acts as supporting document for the project. It identifies the impacts and proposes measures to minimize and mitigate them.

Environmental Management Plan (EMP) is prepared separately for each project road. It comprises (i) a Generic Environmental Management Action Plan (Generic EMAP) for generic mitigation measures which are not directly linked to the site and (ii) a Link Specific Environmental Management Action Plan for mitigation of those impacts, which are specific to the site / corridor.

The remaining part of this EIA document is organized according to the World Bank requirements as follows:

Chapter-2: Project Description, a brief description of the project corridors is given focusing on proposed improvements of corridors, right of way, roadway improvements, cross drainage structures, community facilities, traffic projections etc.

Chapter-3: Environment Regulatory Framework presents the legal and administrative framework of World Bank, Government of India and Government of Tamil Nadu. This section underlines various clearances involved for the project corridor at the State level and at the Central level.

Chapter-4: Baseline Environmental Status pronounces the existing environmental conditions along the corridor ascertained by a reconnaissance survey along with collection of secondary information pertaining to the corridor. Primary data for various environmental parameters was generated using suitable monitoring devises and methodology as stipulated by Central Pollution Control Board.

Chapter-5: Public Consultation was carried out in order to know the reactions of local population and the project affected people, PAP. Meetings were held with the stake holders to record their views on the impacts caused and the suggested remedies to be adopted for the proposed project corridor.

Chapter-6: Analysis of Alternatives was carried out during feasibility study, covered in Environmental Screening report, and the approved alternative is discussed in detail in this chapter.

Chapter-7: Environmental Impacts, likely impacts caused on various environmental and social parameters by activities proposed for the project corridor were recorded in this chapter.

Chapter-8: Mitigation & Enhancement Measures, various mitigation & enhancement measures were suggested for the impacts caused due to various activities.

Chapter-9: References

Chapter 2. Description of the Project

2.1. General

Government of Tamil Nadu (GoTN), on behalf of TNRSP has decided to improve the roads of around 2,050 Km in the State of Tamil Nadu. Under Tamil Nadu Road Sector Project Phase-I (TNRSP-I), World Bank assisted Project, the GoTN has improved the State Highways for a length of about 1,800 Km under various improvement programs such as upgradation, enhanced periodical maintenance, performance based maintenance and Public Private Partnership in pilot basis were also taken up.

The GoTN has now mooted a second phase of works namely Tamil Nadu Road Sector Project-II (TNRSP-II). The TNRSP-II is expected to cover upgradation, maintenance and improvement of the identified core road network and the project is grouped into 5 packages namely PPC01, PPC02, PPC03, PPC04 and PPC05. The improvement mechanism consists of widening and strengthening of existing two lane carriageway to two lane with paved shoulder/ four lane or six lane depending upon the traffic assessment and pavement strengthening along with drainage facility, road furniture and accessories. In some cases new alignments and/or re-alignments may also be required.

Keeping in view the objective of such an exercise, TNRSP commissioned, M/s CDM Smith India Private Limited, Bangalore to undertake the study of road network under package PPC03 as an endeavour to dwell upon appropriate technologies and bring in sophistication in the approach to this Study. The task of study involves carrying out the Feasibility Studies, Environmental and Social Impact Assessment including preparation of Detailed Project Report for upgradation, maintenance and improvement. Corridors under package PPC03 as per the Contract Agreement are given in **Table 1.1** and the Location map is depicted in **Figure 1.1**.

2.2. Present Characteristics

2.2.1. Right of Way (RoW)

Boundary stones for demarcating the ROW are available along the project road. The Available ROW along the project road varies from 20 - 25 m and at built up locations it is varying from 10- 18 m. **Table 2.1** gives the distribution of length and percentage length of Phase-I poject roads with respect to ROW width.

Name of the Road		Total				
Name of the Road	<16	16 – 20	20 – 25	25 - 30	> 30	Length
Tiruchengode - Paramathy	0 Km	9 Km	11.2 Km	6 Km	0 Km	26.2 Km
section of SH 86	0%	34.4%	42.7%	22.9%	0%	100%
Malliyakarai - Tiruchengode	3 Km	17.6 Km	18.4 Km	11.0 Km	0.5 Km	50.6 Km
section of SH 79	5.9%	35%	36.4%	21.7%	1.0%	100%
Mohanur – Namakkal section	0 Km	2.8 Km	1.6 Km	4 Km	5 Km	13.4 Km
of SH 95	0%	20.90%	11.94%	29.85%	37.31%	100%

 Table 2.1
 Summary of Right of Way of Phase-I Roads under PPC03

2.2.2. Traffic Scenario

The vehicle-wise average daily traffic (ADT) figures were estimated by classified count survey. The following table presents a summary of the vehicle-wise AADT (base year 2013) on the project road, for each homogenous section.

Table 2.2.	AADT along Homogeneous Segments of Phase-I Roads under TNRSP-II	
		_

Name of the Corridor	Total Vehicles	AADT (PCUs)
Tiruchengode to Paramathy section of Road No. 2(SH 86)	5415	7152
Malliyakarai to Rasipuram section of Road No.4 (SH 79)	5918	7049
Rasipuram to Tiruchengode section of Road No.4 (SH 79)	7503	7334
Mohanur – Namakkal section of Road No.5 (SH 95)	5426	4920

2.2.3. Road Width

Existing carriageway of Tiruchengode to Paramathy section of Road No. 2 is of bituminous surface with two-lane configuration of approximately 7 m width. Entire project road is lined with earthen shoulder on either side of the carriageway and its width varies from 0.5m to 1.5m. Existing carriageway of Malliyakarai to Rasipuram and Rasipuram to Tiruchengode sections of Road No.4 is of bituminous surface with two-lane configuration with width ranging between 7 m and 7.2m. Entire project road is having earthen shoulder on either side of the carriageway and its width varies from 0.5m to 1.5m. Similarly, existing carriageway of Mohanur to Namakkal section of Road No. 5 is of bituminous surface with two-lane configuration where the width varies between 7 m and 7.2m. Entire project road has earthen shoulder on either side of the carriageway whose width varies from 0.5m to 2.5m.

2.2.4. Land Use and Roadside Environment

The project stretch routes predominantly through plain terrain and in parts through rolling terrain. The land use is agricultural with pockets of major & minor built-ups. Land use pattern for Tiruchengode to Paramathy Section of Road No. 2, includes agriculture (63.83%) and settlement (36.17%) and. For Road No. 4, Malliyakarai to Rasipuram the land cover includes mixed land use dominated by agriculture (71.97%), followed by settlements (23.97%), Forest areas (2.95%) and open area (1.31%) and Rasipuram to Tiruchengode section consists of agriculture (82.41) and settlement (17.59). Mohanur to Namakkal section of Road No. 5 is dominated by settlement (52.60%) followed by open land (28.57%), agricultural land (16.88%) and forest land (1.95%).

2.2.5. Villages and Urban Builtup Sections

Major settlements along the project corridors are Namagiripettai, Rasipuram, Tiruchengode, Mohanur and Namakkal. In theses, Namagiripettai, Rasipuram, Tiruchengode and Namakkal are being bypassed under Rural Development Scheme, GoTN funded by NABARD. Hence, those towns were excluded from the scope of work. The important settlements along the project corridors are given in **Table 4.27**.

2.3. Proposed Improvements

Considering the importance of the project, careful planning has been made to provide various components of the highway. Improvements were proposed as per IRC guidelines and site specific

requirements that may affect the safety and operation of the highway. The proposed improvements are aimed at easing traffic congestion, reducing the road accidents by improving physical characteristics of the road, which includes geometry, pavement strength, drainage, road safety appurtenance and also enhancing the aesthetics. General philosophy followed in formulating the improvement proposals are;

- Improve the existing project facilities and introducing new facilities
- Strengthening/reconstruction/ new construction of the existing pavement;
- Improvement of geometric deficient curves;
- Provision of footpath cum built-up drains;
- Provision of utility corridors and cross ducts at junctions;
- Junction improvements;
- Widening/ reconstruction of existing Bridge and culverts and provision of additional culverts depending on the drainage condition;
- Provision for Pedestrian crossing facilities;
- Provision of traffic signs and road furniture;
- Improvement of road safety features;
- Provision of bus bays, Truck lay bays and passenger shelters.

2.3.1. Proposed Carriageway Configuration and Cross Sections

2.3.1.1. Tiruchengode to Paramathy Section of Road No. 2 (SH 86)

The project road predominantly has a two-lane carriageway width ranging from 7 to 7.2 m and 0.5 to 1.5m earthen shoulder on both sides except from Km 65+100 to Km 66+000. It has Intermediate Divided Carriageway of 5.5 m width with median of 1.5 m at Kandampalayam built-up.

Based on traffic assessments, project corridor warrants two lane with paved shoulder.

2.3.1.1.1. Cross Sectional Elements

Uniform cross sectional elements for both two with paved shoulder and four lane are formulated by TNRSP and the parameters are given below. Uniform cross sectional elements for two lane with paved shoulder is formulated by TNRSP. Further to the discussions with the client, the typical parameters are modified as per site conditions and final cross section elements are given below.

Urban Section – Two Lane with Paved Shoulders

- Main Carriageway 7.0m (2x3.5m);
- Paved Shoulders Varies (end to end paved up to available space);
- Water table/ Road gullies 0.6 (0.3x2);
- Earthen shoulder Nil;
- Foot path cum drain with utility duct 4.0m(2X2m);
- Right of way Minimum 16m.

Village Section – Two Lane with Paved Shoulders

• Main Carriageway – 7.0m (2x3.5m);

- Paved Shoulders 2.5m (each on both sides);
- Water table/ Road gullies 0.6 (0.3x2);
- Earthen shoulder Nil;
- Open lined drain 3.0m (2X1.5m);
- Utility corridor 2.4m (2X1.2m);
- Right of way –16m.

Rural Section – Two Lane and Paved Shoulders

- Main Carriageway 7.0m (2x3.5m);
- Paved Shoulders 1.5m (each on both sides);
- Water table/ Road gullies Nil;
- Earthen Shoulders 1.0m (each on both sides);
- Embankment slope 1 in 3;
- Open earthen drains on both sides;
- Utility corridor 2.0m (2X1.0m);
- Right of way Minimum 23m.

Typical cross sections for different road sections were developed and is summarized as below -

- C2-U-R (F): Two Lane Carriageway with Paved Shoulder in Urban Area (Full depth Reconstruction)
- C2-U-O: Intermediate Divided Carriageway in with Paved Shoulder in Urban Area (Overlay)
- C2-V-O: Two Lane Carriageway with Paved Shoulder in Village Area (Overlay)
- C2-V-R (P): Two Lane Carriageway with Paved Shoulder in Village Area (Partial Depth Reconstruction)
- C2-V-R (F): Two Lane Carriageway with Paved Shoulder in Village Area (Full Depth Reconstruction)
- C2-R-O: Two Lane Carriageway with Paved Shoulder in Rural Area (Overlay)
- C2-R-R (P): Two Lane Carriageway with Paved Shoulder in Rural Area (Partial Depth Reconstruction)
- C2-R-R (F): Two Lane Carriageway with Paved Shoulder in Rural Area (Full Depth/New Reconstruction)

The chainage wise details of typical cross section are given in **Annexure 2.1**. Drawing of typical cross sections types is presented as **Annexure 2.2**.

2.3.1.2. Malliyakarai to Rasipuram and Rasipuram to Tiruchengode Sections of Road No. 4 (SH 79)

The project road of both the sections predominantly has a two-lane carriageway width ranging from 7 to 7.2 m and 0.5 to 1.5 m earthen shoulder on both sides of the project road. At built-ups of Rasipuram & Thiruchengode Carriageway widths vary from 10 to 12m.

Based on traffic assessments explained in data report, project corridor warrants two lane with paved shoulder for section I and II.

2.3.1.2.1. Cross Sectional Elements

Uniform cross sectional elements for two lane with paved shoulder is formulated by TNRSP. Further to the discussions with the client, the typical parameters are modified as per site conditions and final cross section elements are given below

Urban Section – Two Lane with Paved Shoulders (Section I and II)

- Main Carriageway 7.0m (2x3.5m);
- Paved Shoulders 5m (2 x 2.5m);
- Water table/ Road gullies 0.6 (0.3x2- Included paved shoulder);
- Earthen shoulder Nil;
- Foot path cum drain with utility duct 4.0m (2x2m);
- Right of way Minimum 16m.

Urban Section – Intermediate lane (Section II at Vaiyappamali Village)

- Median 0.5 (0.25x2), Shyness 0.5 (0.25x2)
- Main Carriageway 11.0m (2x5.5m);
- Foot path cum drain with utility duct 4.0m (2X2m);
- Right of way Minimum 16m.

Village Section – Two Lane with Paved Shoulders (Section I and II)

- Main Carriageway 7.0m (2x3.5m);
- Paved Shoulders 5m (2 x 2.5m);
- Water table/ Road gullies 0.6 (0.3x2- Included paved shoulder);
- Earthen shoulder Nil;
- Covered lined drain -2.0m (2x1m);
- Utility corridor 2m (2x1m);
- Right of way Minimum 16m.
- Rural Section Two Lane and Paved Shoulders (Section I and II)
 - Main Carriageway 7.0m (2x3.5m);
 - Paved Shoulders 3m (2x1.5m);
 - Water table/ Road gullies Nil;
 - Open earthen drains on both sides;
 - Embankment slope 1 in 3;
 - Open earthen drains on both sides;
 - Utility corridor 2.0m (2x1.0m);
 - Right of way Minimum 23m.

Typical cross sections for different road sections were developed and are summarized as below.

- C4–U O Two Lane Carriageway with Paved Shoulder in Urban Area (Overlay)
- C4-U P Two Lane Carriageway with Paved Shoulder in Urban Area (Partial Reconstruction)
- C4–U N Two Lane Carriageway with Paved Shoulder in Urban Area (New Construction)
- C4–V O Two Lane Carriageway with Paved Shoulder in Village Area (Overlay)
- C4–V P Two Lane Carriageway with Paved Shoulder In Village Area (Partial Reconstruction)
- C4–V N Two Lane Carriageway with Paved Shoulder in Village Area (New Construction)
- C4–R O Two Lane Carriageway with Paved Shoulder in Rural Area (Overlay)
- C4–R P Two Lane Carriageway with Paved Shoulder in Rural Area (Partial Reconstruction)
- C4–R N Two Lane Carriageway with Paved Shoulder in Rural Area (New Construction)
- C4–F O Two Lane Carriageway with Paved Shoulder in Forest section RHS (Over lay)
- C4–F O Two Lane Carriageway with Paved Shoulder in Forest Area LHS (Overlay)
- C4–U P Intermediate carriageway in Vaiyappanmalai Location (Partial depth reconstruction)

The chainage wise details of typical cross section are given in **Annexure 2.1**. Drawing of typical cross sections types is presented as **Annexure 2.2**.

2.3.1.3. Mohanur to Namakkal Section of Road No. 5 (SH 95)

The project road of both the sections predominantly has a two-lane carriageway width ranging from 6 to 7.2 m and 0.5 to 1.5m earthen shoulder on both sides of the project road. At built-up of Mohanur Carriageway widths vary from 7 to 9m.

Based on traffic assessments explained in Chapter 3 of Main Report Volume, project corridor warrants two lane with paved shoulder for section I.

2.3.1.3.1. Cross Sectional Elements

Uniform cross sectional elements for two lane with paved shoulder is formulated by TNRSP. Further to the discussions with the client, the typical parameters are modified as per site conditions and final cross section elements are given below

Urban Section – Four Lane with Paved Shoulders (from Ch.0+600 to Ch.2+100)

- Main Carriageway 14.0m (2x7m);
- Paved Shoulders Varies (end to end paved up to available space);
- Water table/ Road gullies 0.6 (0.3x2 -Included in paved shoulder edges)
- Earthen shoulder Nil;

- Foot path cum drain with utility duct 4.0m(2x2m);
- Right of way Minimum 20m.

Urban Section – Two Lane with Paved Shoulders (from Ch.0+000 to Ch.0+600)

- Main Carriageway 7.0m (2x3.5m);
- Paved Shoulders 5m (2 x 2.5m);
- Water table/ Road gullies 0.6 (0.3x2- Included in paved shoulder edges);
- Earthen shoulder Nil;
- Foot path cum drain with utility duct 4.0m(2x2m);
- Right of way Minimum 16m.

Village Section – Two Lane with Paved Shoulders (Section I)

- Main Carriageway 7.0m (2x3.5m);
- Paved Shoulders 5m (2 x 2.5m);
- Water table/ Road gullies 0.6 (0.3x2 -Included in paved shoulder edges)
- Earthen shoulder Nil;
- Covered lined drain -2.0m (2x1m);
- Utility corridor 2m (2x1m);
- Right of way –16m.

Rural Section – Two Lane and Paved Shoulders (Section I)

- Main Carriageway 7.0m (2x3.5m);
- Paved Shoulders 3m (2x1.5m);
- Water table/ Road gullies Nil;
- Earthen Shoulders 2.0m (2 x1m);
- Open earthen drains on both sides;
- Utility corridor 2.0m (2x1.0m);
- Right of way Minimum 23m.

Typical cross sections for different road sections were developed and is summarized as below.

- C5 –U-P- Four Lane Divided Carriageway with Paved Shoulder/Available Space in Urban Area from Ch.0+600 to 2+100 with ROW varying from 20m To 30m
- C5 –U-P- Two Lane Carriageway with Paved Shoulder/Available Space in Urban Area from Ch. 0+000 to 0+600 with ROW varying from 16m To 20m
- C5 V-P- Two Lane Carriageway with Paved Shoulder in Village Area
- C5 R-P- Two Lane Carriageway with Paved Shoulder in Rural Area
- C5 R-N- Two Lane Carriageway with Paved Shoulder in Realignment Area
- C5 R-P- Two Lane Carriageway Paved Shoulder in Forest Area
- C5 R-O- Existing Two Lane ROB Approach

The chainage wise details of typical cross section are given in **Annexure 2.1**. Drawing of typical cross sections types is presented as **Annexure 2.2**.

2.3.2. Identification of Realignment and Bypass Provisions

There are no bypasses proposed to any of the TNRSP-II Phase-I Roads. Minor realignments are proposed at deficient geometric locations. Locations of realignments are given in the **Table 2.1**. Detailed discussion on identification of realignment provision is presented in **Chapter 6**. Analysis of Alternatives.

Sl. No.	Cl	nainage	Length (m)				
51. INU.	From (Km)	To (Km)	Length (III)				
Tirucheng	Tiruchengode to Paramathy section of Road No. 2(SH 86)						
1	55+600	55+750	150.0

2	6+680	6+930	350				

Table 2.1.	List of Realignment Locations of Phase-I Roads under PPC03
------------	--

2.4. Culvert and Bridges

The Bridge and culvert inventory was carried out to assess the existing condition and the hydrological adequacy. The detailed information on all the structural components, HFL, LWL dimensions of all the components, linear water way, vertical clearances, drainage spouts, handrails etc. are recorded.

2.4.1. Tiruchengode to Paramathy Section of Road No. 2(SH 86)

There are 28 culverts and 1 bridge on the project stretch. New balancing cross drainage structures have been proposed along the existing road based on terrain, vertical geometry etc. following IRC SP 13 guidelines. A summary of improvement proposals for cross-drainage structures are given in **Table 2.2** and

Table 2.3.

1	61+955	15 x 4.4	New construction on Realignment	6 x 10.5 x 4.5

The formation width of new bridges and culverts has been considered as follows:

- Culverts-12.0 m
- Bridge with footpath- 14.8 m
- Bridge without footpath- 12.9 m

2.4.1.3. Mohanur to Namakkal Section of Road No. 5 (SH 95)

There are 19 culverts, 1 bridge and 1 ROB on the project stretch. New balancing cross drainage structures have been proposed along the existing road based on terrain, vertical geometry etc. following IRC SP 13 guidelines. A summary of improvement proposals for cross-drainage structures are given in **Table 2.8**, **Table 2.9** and **Table 2.10**.

2.5. Identification of Borrow Areas

Extensive survey was conducted to identify borrow areas for locating suitable soil/soil aggregates mixes to be used in the construction of embankment and sub-grade. Efforts were made to locate borrow areas near the project road to avoid long haulage of the materials. Similarly, detailed survey

was carried out to identify stone metal quarries of hard stone for use in Granular Sub-base (GSB), Wet Mix Macadam (WMM), bituminous and cement concrete works.

The following conclusions have been made based on the exploration of potential borrow sources:

- Construction materials are available with in an economical lead;
- Construction materials can be obtained/exploited without any hassles during the implementation of the project;
- The soil/crushed stone aggregates/ sand etc are exhibiting higher strength properties than recommended.
- To procure good quality crushed stone aggregate in large quantity, the contractor is required to install his own crushing plant thus enhancing the quality of the materials;

2.6. Geotechnical Investigation

Geotechnical investigations are carried out at proposed bridge locations to explore subsurface conditions by drilling boreholes to different depths in order to identify the thickness and sequences of various strata and to ascertain the sub surface profile of soils and bed rock to determine the most suitable foundation levels of structures.

2.7. Hydraulic and Hydrological Investigations

All the hydraulic data for bridges has been collected from the field and it has been analyzed and studies carried out to determine the waterway of the new bridges to be constructed as per provisions of **IRC: 5-1998** and **IRC: SP-13**. 50 year return flood was considered.

2.8. Road Safety Review

Traffic safety, control devices and appurtenances are missing or ill maintained. Visibility of the existing marking or signboard is also another cause of concern. Dedicated signs for pedestrian crossing is also absent except at some locations. Place identification, cautionary, warning and mandatory signs are also missing at important location like curves, intersections, schools and built-ups.

Traffic signs, road markings, and lighting are important features of traffic safety and control devices; they transmit visually vital information to drivers, and ensure increased safety and efficiency in free flow of traffic. The standard road markings and traffic signs give information about highway routes, directions, and destinations. These also give information on special obligations, prohibitions, and restrictions and caution about the existence of any hazardous conditions on or adjacent to the roadway. IRC standards were adopted for both markings and signs.

2.8.1. Road Marking

The specification and standards for road markings are as per IRC: 35 1997. Lane markings are provided both with Thermoplastic paint mixed with retro-reflective beads throughout and with Raised Pavement Markers (Cat's eye) on curves. The lane marking are provided at 3.5 m lane width and

edges of paved shoulders are proposed. The cat's eyes at curves are provided at 9 m intervals placed at the center of the line marking spacing for improve visibility and drivability during night drive.

Edge markings are provided at the carriageway edges. The markings are continuous strip of painting with breaks at the junctions. Other markings, viz, island marking, warning lines, chevron markings and directional arrows, etc. are provided at suitable locations.

2.8.2. Traffic Signs

Various traffic signs, viz, regulatory, cautionary and information signs are provided in the project road at curves, intersections, median openings and at all necessary places. The specifications and standards for traffic signs are as per IRC: 67-2012. List of road signs are given in **Table 2.11**. **Table 2.12** gives the summary of the number of proposed road signs.

Typical Signs	List of Signs			
Mandatory / Regulatory Signs	Stop Sign			
Wandatory / Regulatory Signs	No parking Signs at locations of 2.5m paved shoulder			
	Curve Sign			
	Object Marker			
	Side Road			
Cautionary / Warning Signs	Chevron Signs for curves			
	Red reflectors			
	Keep left			
	Cat's eyes			
	Advanced Direction Sign			
	Route Marker Sign			
	Place Identification Sign			
Information Sign	Overhead Cantilever Sign Boards			
	Cluster of Reflectors			
	Overhead Gantry Sign Boards			
	Bus Stop

2.8.3. Pedestrian Hand Rails

Pedestrian hand rails are proposed at following locations;

- At all major junctions
- Schools and hospitals
- Bus bay locations

2.8.4. Project Facilities

Adequate provisions of wayside amenities are provided on the project road to improve the safety for the convenience of road users and aesthetics of the surrounding environment.

Litter Bins: Litter bins are provided at all bus bays and passenger shelter locations for temporarily storing the refuse and waste. Also two bins each are provided at all major junctions of the project corridor.

2.8.5. Bus Bays with Passenger's Shelters

Bus bays with passenger shelters are provided with adequate paving of lay bye area, drainage and road markings confirming to IRC_80:1998, where adequate space is available considering the safety and future traffic. Additional facilities like Pedestrian crossings, signboards, etc. are also provided at these locations for enhanced safety. Details of bus bay location are presented in **Table 2.13**. A typical layout is shown **Figure 2.1** and **Figure 2.2**.

Project Preparation Consultancy Services for preparing Detailed Project Report (DPR) for various road improvement works under Tamil Nadu Road Sector Project II (TNRSP II): Contract PPC03

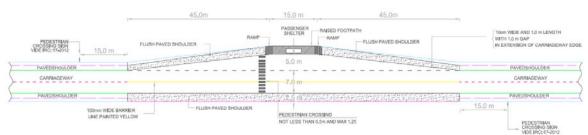

Figure 2.2. Typical Layout of a Bus Bay (5.0m wide)

2.8.6. Pedestrian Crossings

Adequate pedestrian crossing facilities conforming to IRC_103:2012 are provided at all important intersections and such other locations where substantial conflict exists between vehicular and pedestrian movements.

2.8.6.1. Crossings at Intersections

Controlled form of at-grade pedestrian crossings with zebra lines and road studs are provided at all major intersections with ample lighting to facilitate night vision at crossings. A separate signal phase is provided for pedestrian crossings at signalized junctions.

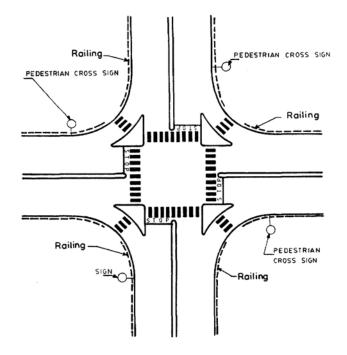

Figure 2.3. Type Design of Four Arm Channelised Intersection Showing Arrangement of Zebra Crossing

2.8.6.2. Mid Block Zebra Crossings

With reference to IRC_103:2012, mid-block zebra crossings are provided where distance between two consecutive intersections is more than 300 m and simultaneously, there is a genuine demand for such facility i.e. at important crossing locations like schools, hospitals and bus stop locations.

At such important crossing locations, provision is given for additional safety measures like raised footpath and railings along with zebra crossings and road studs with markings and cautionary signs.

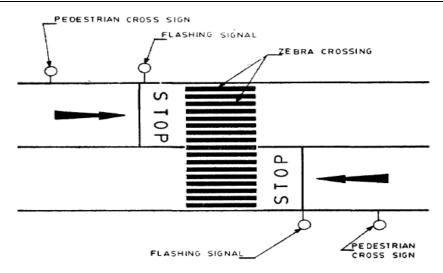

Figure 2.5. Table Top Pedestrian Crossing

2.9. Road Construction Standards, Norms and Guidelines

Codes of Practice of Indian Road Congress (IRC), particular to environmental issues, which are relevant to the proposed project, are presented as **Annexure 2.3**. These guidelines should be followed by the implementing agency during road construction

Chapter 3. Environmental Regulatory Framework

3.1. Applicable Regulations

The chapter presents a review of the existing institutions and legislations relevant to the project at the National and State level. The various statutory clearances from various state and central government authorities and the institutional and legal frameworks are discussed in the following sections.

3.1.1. Legal Framework

The Government of India has laid out various policy guidelines, acts and regulations pertaining to environment. The Environment (Protection) Act, 1986 provides umbrella legislation for the protection of environment. As per this Act, the responsibility to administer the legislation has been jointly entrusted to the Ministry of Environment, Forests and Climate Change (MoEF&CC) and Central Pollution Control Board (CPCB) / Tamil Nadu Pollution Control Board (TNPCB) in the present context. More details on the legal framework of Government of India and State Government regulations and clearance procedures are envisaged in the following Sections.

3.1.2. Key Environmental Laws and Regulations of GoI

The Indian constitution makes environmental protection an explicit duty for every citizen by the statement, "It shall be duty of every citizen of India to protect and improve the environment including forests, lakes, rivers, wild life, and to have compassion for living creatures". In addition, GoI has laid out various policy guidelines, acts and regulations pertaining to sustenance of environment and these have been presented in the following sections.

3.1.2.1. Environment (Protection) Act, 1986

The Environmental (Protection) Act, 1986 is the umbrella legislation providing for the protection of environment in the country. This Act provided for the Environment (Protection) Rules, which were formulated in 1986, the Environmental Impact Assessment Notification, 1994 and the Amendments thereto (up to July 2004), and various other notifications.

3.1.2.2. EIA Notification, 2006

The EIA notification dated 14th September, 2006 imposes certain restrictions and prohibitions on new projects or activities, or on the expansion or modernization of existing projects or activities based on their potential environmental impacts as indicated in the schedule to the notification, being undertaken in any part of India, unless prior environmental clearance has been accorded by the Ministry of Environment, Forests and Climate Change (MoEF&CC) or the State or Union territory Level Environment Impact Assessment Authority (SEIAA).

Item No 7(f) of the EIA notification, 2006 specifies that Expansion of National Highways greater than 100 Km involving additional right of way or land acquisition greater than 40 m on existing alignments and 60 m on realignments or bypasses is categorized as "A" project and requires prior environmental clearance from MoEF&CC. Whereas, all new State Highway projects; and expansion of State Highways in hilly terrain (above 1,000 m above mean sea level) and or ecologically sensitive areas falls in Category 'B' project and requires prior environmental clearance from SEIAA.

The proposed Phase-I roads under TNRSP-IIare not attracting the provisions of EIA Notification, 2006 since they are not National Highways or new State Highways. Even though this project involves expansion of existing State Highways, they are not falling in hilly terrain above 1000 m above mean sea level or eco sensitive areas. Hence, the project roads do not require environmental clearance from SEIAA or MoEF&CC.

3.1.2.3. The Water (Prevention & Control of Pollution) Act, 1974

This act provided for the prevention and control of water pollution and the maintaining and restoring of the wholesomeness of water. The Act resulted in the establishment of the Central and State level Pollution Control Boards whose responsibilities include managing water quality and effluent standards, as well as monitoring water quality, prosecuting offenders and issuing licenses for construction and operation of certain facilities.

The Contractor has to obtain consent to establish for construction camps from the Tamil Nadu Pollution Control Board as per the Water (Prevention and Control of Pollution) Act of 1974, since it involves discharge of waste water from construction camps.

3.1.2.4. The Air (Prevention & Control of Pollution) Act, 1981

This act provides for prevention, control and abatement of air pollution. 'Air Pollution' means the presence in the atmosphere of any 'air pollutant' which means any solid, liquid or gaseous substance (including noise) present in the atmosphere in such concentration as may be or tend to be injurious to human beings or other living creatures or plants or property or environment.

The SPCB is empowered to implement air quality standards and monitor and prosecute offenders under The Air (Prevention and Control of Pollution) Act, 1981. The Contractor has to obtain consent to establish and consent to operate for construction camps from the Tamil Nadu Pollution Control Board as per the Air (Prevention and Control of Pollution) Act of 1981, since it involves operation of Hot Mix Plants and Diesel Generator Sets.

3.1.2.5. Noise Pollution (Regulation and Control) Rules, 2000

The ambient air quality standards in respect of noise for different areas/zones are specified in the Schedule of these rules. The State Government may categorize the areas into industrial, commercial, residential or silence areas/zones for the purpose of implementation of noise standards for different areas. As per these rules, an area comprising not less than 100 meters around hospitals, educational institutions and courts may be declared as silence area/zone.

The noise levels in any area/zone shall not exceed the ambient air quality standards in respect of noise as specified in the Schedule. The State Pollution Control Board is responsible for the enforcement of noise pollution control measures and the due compliance of the ambient air quality standards in respect of noise. The proposed project in its construction and operation phases may attract the provisions of these rules if the noise level from the construction machinery and the vehicles are above the standards.

3.1.2.6. Fly Ash Notification, 2007

The notification specifies the responsibility of highway agencies for use of fly ash for road construction, if any thermal power plant is located within 100 Km from it. Since, Mettur Thermal Power Plant is located within 100 Km from the proposed project corridors, provisions of the said notification is applicable for the project.

3.1.2.7. The Explosives Act (& Rules), 1884 (revised in 1983)

This Act specifies regulations regarding the use of explosives and precautionary measures while blasting and quarrying. Provisions of these rules are applicable to this project.

3.1.2.8. The Municipal Solid Waste (Management & Handling) Rules, 2000

The Municipal Solid Waste (management & Handling) Rules, 2000 (MSW Rules) establish consistent regulation governing collection, segregation, transportation, and disposal of types of municipal solid wastes throughout India. The MSW Rules seeks to minimize the burden of on landfills for the disposal of municipal waste by adopting appropriate waste segregation and treatment technologies. Establishing construction camp during construction phase may attract the provisions of this rule.

3.1.2.9. The Hazardous Waste (Management, Handling and Transboundary Movement) Rules, 2008

The Hazardous Wastes (Management, Handling and Trans boundary movement) Rules, 2008 and its subsequent amendment were created to provide 'cradle-to grave' or comprehensive guidance to the generators, transporters and operators of disposal facilities among others, and monitoring norms for State governments. As per the provisions of Rules, every occupier handling, or recycler recycling, hazardous wastes including facility for collection, reception, treatment, transport, storage and disposal of such wastes is required to obtain authorization from concerned State Pollution Control Board (SPCB) / Pollution Control Committee (PCC) in UT for any of the said activities.

3.1.2.10. The E-Waste (Management and Handling) Rules, 2011

These rules shall apply to every producer, consumer or bulk consumer involved in the manufacture, sale, purchase and processing of electrical and electronic equipment or components as specified in Schedule I (of E-Waste (Management and Handling) Rules, 2011), collection centre, dismantler and recycler of e-waste. The project is likely to generate e-waste from the equipment and machineries used construction activity. Hence the said rule is applicable for the subject project.

Workers engaged in dismantling and handling e-waste are to be issued with proper personal protective equipment (gloves, dust mask etc.) The recoverable items are to be sold only to authorized recyclers.

3.1.2.11. Batteries (Management and Handling) Rules, 2001

These rules shall apply to every manufacturer, importer, re-conditioner, assembler, dealer, recycler, auctioneer, consumer and bulk consumer involved in manufacture, processing, sale, purchase and use of batteries or components thereof. Establishing construction camp may attract these kind of activities and applicable for the subject project.

3.1.2.12. Policies of Ministry of Environment, Forests and Climate Change, Government of India

National Environmental Policy, 2006

This policy intends to mainstream environmental concerns in all developmental activities. The policy stresses on conservation of critical environmental resources, intra-generational and inter-generational equity, efficiency in environmental resource use and adoption of a pre-cautionary approach

Ground Water Recharge

Groundwater recharging structures should be constructed along the road for ground water recharge. MoEF&CC insists this while issuing environmental clearance for road projects.

3.1.3. Environmental Requirements of the State

3.1.3.1. Tamil Nadu Forest Act 1882 and Tamil Nadu Timber Transit Rules

No person shall move timber notified as Schedule Timber under the Tamil Nadu Forest Act, 1882 into or from or within the State by land, water or air unless such timber is accompanied by a permit issued by the Tamil Nadu Forest Department. Black wood, Red Sanders, Rosewood, Sandalwood and Teakwood are trees notified as Schedule Timber under Tamil Nadu Forest Act, 1882. Since the project envisages cutting of non-schedule trees for widening of existing at-grade road, requires permit from respective District Collectors and forest department for cutting of trees and their transportation.

3.1.4. Other Legislation Applicable to Road Construction

Environmental issues during road construction stage generally involve equity, safety, and public health issues. The road construction agencies require complying with laws of the land, which include *inter alia*, the following.

- Workmen's Compensation Act 1923 (the Act provides for compensation in case of injury by accident arising out of and during the course of employment);
- Payment of Gratuity Act, 1972 (gratuity is payable to an employee under the Act on satisfaction of certain conditions on separation if an employee has completed 5 years);
- Employees PF and Miscellaneous Provision Act, 1952 (the Act provides for monthly contributions by the employer plus workers);
- Maternity Benefit Act, 1951 (the Act provides for leave and some other benefits to women employees in case of confinement or miscarriage, etc.);
- Contact Labor (Regulation and Abolition) Act, 1970 (the Act provides for certain welfare measures to be provided by the contractor to contract labour);
- Minimum Wages Act, 1948 (the employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the);
- Payment of Wages Act, 1936 (it lays down as to by what date the wages are to be paid, when it will' be paid and what deductions can be made from the wages of the workers);

- Equal Remuneration Act, 1979 (the Act provides for payment of equal wages for work of equal nature to Male and Female workers and not for making discrimination against Female employees);
- Payment of Bonus Act, 1965 (the Act provides for payments of annual bonus subject to a minimum of 83.3% of wages and maximum of 20% of wages);
- Industrial Disputes Act, 1947 (the Act lays down the machinery and procedure for resolution of industrial disputes, in what situations a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing down the establishment);
- Industrial Employment (Standing Orders) Act; 1946 (the Act provides for laying down rules governing the conditions of employment);
- Trade Unions Act, 1926 (the Act lays down the procedure for registration of trade unions of workers and employers. The trade unions registered under the Act have been given certain immunities from civil and criminal liabilities);
- Child Labour (Prohibition and Regulation) Act; 1986 (the Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of child labour is prohibited in Building and Construction Industry);
- Inter-State Migrant Workmen's (Regulation of Employment and Conditions of Service) Act, 1979 (the inter-state migrant workers, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, traveling expenses from home to the establishment and back, etc.);
- The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act, 1996 and the Cess Act of 1996 (all the establishments who carry on any building or other construction work and employs 10 or more workers are covered under this Act; the employer of the establishment is required to provide safety measures at the building or construction work and other welfare measures, such as canteens, first-aid facilities, ambulance, housing accommodation for Workers near the workplace, etc.);
- The Factories Act, 1948 (the Act lays down the procedure for approval of plans before setting up a factory, health and safety provisions, welfare provisions, working hours and rendering information-regarding accidents or dangerous occurrences to designated authorities);
- Chemical Accidents (Emergency Planning, Preparedness and Response) Rules, 1996.(this rule provides for operation of on-site and Off-site Emergency Plans during chemical disaster)

3.1.5. World Bank Environmental Requirements

3.1.5.1. Operational Policies of the World Bank

The following World Bank Operational Policies (OP) are relevant with respect to the proposed project and are reviewed below:

- OP 4.01 Environmental Assessment
- OP 4.04 Natural Habitats
- OP 4.11 Physical Cultural Resources
- OP 4.12 Involuntary Resettlement

• OP 4.36 – Forests

O.P. 4.01. Environmental Assessment

O.P. 4.01 intents to help ensure the environmental and social soundness and sustainability of investment projects and to support integration of environmental and social aspects of projects into the decision making process.

OP 4.01 specifies the environmental screening to be carried out for each proposed project to determine the appropriate extent and type of EA to be carried out. Projects are classified into one of following four categories, depending on the type, location, sensitivity, and scale of the project and the nature and magnitude of its potential environmental impacts.

Category A: A proposed project is classified as Category A if it is likely to have significant adverse environmental impacts that are sensitive, diverse, or unprecedented. These impacts may affect an area broader than the sites or facilities subject to physical works. EA for a Category A project examines the project's potential negative and positive environmental impacts, compares them with those of feasible alternatives (including the "without project" situation), and recommends any measures needed to prevent, minimize, mitigate, or compensate for adverse impacts and improve environmental performance. A comprehensive Environmental Impact Assessment Report is to be prepared for a Category A project.

Category B: A proposed project is classified as Category B if its potential adverse environmental impacts on human populations or environmentally important areas – including wetlands, forests, grasslands, and other natural habitats – are less adverse than those of Category A projects. These impacts are site-specific; few if any of them are irreversible; and in most cases mitigatory measures can be designed more readily than for Category A projects. The scope of EA for a Category B project may vary from project to project, but it is narrower than that of Category A Environmental Assessment.

Category C: A proposed project is classified as Category C if it is likely to have minimal or no adverse environmental impacts. Beyond screening, no further EA action is required for a Category C project.

Based on the assessment of project activities and their anticipated impacts, the selected corridors in the project has been categorized as "Category A Project" and requires a project specific EA and EMP.

O.P. 4.04. Natural Habitats

The objective of this policy is to promote environmentally sustainable development by supporting the protection, conservation, maintenance, and rehabilitation of natural habitats and their functions. Operational Policy 4.04 is applicable to the project, Since, Section 1 of Road no. 4 - Malliyakarai to Rasipuram section of SH 79 & Road no. 5 – Mohanur to Namakkal Section of SH 95 is abutting reserved forests areas.

O.P. 4.11. Physical Cultural Resources

This policy addresses physical cultural resources, which are defined as movable or immovable objects, sites, structures, groups of structures, and natural features and landscapes that have archaeological, paleontological, historical, architectural, religious, aesthetic, or other cultural significance. Impacts on physical cultural resources should be addressed as an integral part of the EA

process. The following projects are to be classified during the environmental screening process as Category A or B:

- Any project involving significant excavations, demolition, movement of earth, flooding, or other environmental changes; and
- Any project located in, or in the vicinity of, a physical cultural resources site.

The proposed fast track corridor does not fall in any of the categories described above.

O.P. 4.12. Involuntary Resettlement

The bank's policy on involuntary resettlement covers those displaced by the project's activities. For any sub-project involving land acquisition and associated impacts, a draft RAP is required, prior to the approval of sub-project and borrowers will implement the RAP in advance of sub-project implementation. Since land acquisition is involved in this sub-project, RAP is to be prepared for this sub-project.

O.P. 4.36. Forests

The objective of this policy is to harness the potential of forests to reduce poverty in a sustainable manner, integrate forests effectively into sustainable economic development, and protect the vital local and global environmental services and values of forests. This policy applies to the following types of bank-financed investment projects:

Projects that have or may have impacts on the health and quality of forests;

Projects that affect the rights and welfare of people and their level of dependence upon or interaction with forests; and

Projects that aim to bring about changes in the management, protection or utilization of natural forests or plantations, whether they are publicly, privately or communally owned.

The Bank does not finance projects that in its opinion would involve significant conversion or degradation of critical forest areas or related critical natural habitats. The project roads trigger the OP 4.36. Since, Section 1 of Road no. 4 - Malliyakarai to Rasipuram of SH 79 & Road no. 5 – Mohanur to Namakkal Section of SH 95 is abutting reserved forests areas. However, there is no conversion of critical forest areas or related critical natural habitats for proposed project improvement.

3.1.6. Summary of Clearance Requirement

Summary of clearance required for the project roads under various regulations discussed above is presented in **Table 3.1**.

Sl. No	Type of Clearance	Statutory Authority	Applicability	Project Stage	Time Required	Responsibility
1	Tree felling	District	Felling of	Pre	1 month	GoTN/ TNRSP
	permission	Collector &	avenue trees	construction		
		Forest				
		Department				

 Table 3.1.
 Environmental Regulations Applicable to Phase-I Roads under TNRSP-II PPC03

Sl.	Type of	Statutory	Applicability	Project	Time	Responsibility
No	Clearance	Authority		Stage	Required	
2	Consent to Establish under Air and Water Acts	Tamil Nadu Pollution Control Board	For establishing Hot mix plants, Crushers and batching plants	Construction (Prior to work initiation)	2-3 months	Concessionaire / Contractor
3	Consent to Operate under Air and Water Acts	Tamil Nadu Pollution Control Board	For operating Hot mix plants, Crushers and batching plants	Construction (Prior to work initiation)	1-2 months	Concessionaire / Contractor
4	Permission to store Hazardous wastes	Tamil Nadu Pollution Control Board	Storage, Transportation & Disposal of Hazardous Wastes	Construction (Prior to work initiation)	2-3 months	Concessionaire / Contractor
5	Explosive license	Chief Controller of Explosives, petroleum & Explosive Safety Organisation	Storage of explosive materials and Petroleum products	Construction (Prior to work initiation)	2-3 months	Concessionaire / Contractor
6	PUC certificate for vehicles for construction	Transport Department of Tamil Nadu	For all construction vehicles	Construction (Prior to work initiation)	1-2 months	Concessionaire / Contractor
7	Quarry lease deeds and license	Mines and Geology Department of Tamil Nadu	Quarrying and borrowing operations	Construction (Prior to work initiation)	2-3 months	Concessionaire / Contractor
8	NOC for water extraction for construction and allied works	Central Ground Water Authority	Ground water extraction	Construction (Prior to work initiation)	2-3 months	Concessionaire / Contractor

Chapter 4. Baseline Environmental Status

4.1. Background

Collecting the baseline environmental status of the project influence area helps to predict the magnitude of impacts that are likely to be caused due to the proposed improvements of the selected project roads on different environmental components of the project influence area. In order to assess the baseline environmental status of the project influence area, field visits were conducted by the Consultant. This involved field inspection at all the sensitive locations, collection of secondary information for all the environmental components and discussions with the officials of various departments, NGO's and local public.

Based on the existing environmental scenario potential impacts of road improvement will be identified and accordingly management plan will be proposed in forthcoming sections. The baseline environmental conditions will help in comparing and to monitor the predicted negative and positive impacts resulting from the project during construction and operation phases.

Data was collected from secondary sources for the macro-environmental setting like climate, physiography (Geology and slope), biological and socio-economic environment. Firsthand information have been collected to record the micro-environmental features within and adjacent to the project corridor. Collection of first hand (Primary) information includes preparation of base maps, extrapolating environmental features on proposed road design, tree enumeration, location and measurement of socio-cultural features abutting project road. Data was also recorded at sites used for extraction of materials for construction but generally outside the project corridor e.g. borrows areas and quarries.

Ambient Air, Noise and water quality samples were collected at important locations in terms of environment quality to prepare a baseline database. Consultation was another source of information to explain local conditions like submergence, recent floods etc. However these consultation results were largely based on short term memories like information on floods, submergence but still it was helpful in comparing secondary information.

As part of baseline environmental study, environmental monitoring was conducted for environmental attributes such as Air, Noise, Water and Soil. The sampling and monitoring locations were identified based on the land use type, topography and the sensitive receptors present along the project corridors. Environmental monitoring was conducted for one month between mid of February to mid of March. Ambient air quality was measured at 6 locations and the ambient noise level was measured at 12 locations. Ground water samples were drawn from 8 locations and Soil samples were collected from 5 locations along the project road. In addition to the baseline environmental monitoring, field inspection at all the sensitive locations, collection of secondary information for all the environmental components and discussions with the officials, NGO's and local public were conducted by the Consultants. A joint site inspection was conducted with Forest officials on 10th January, 2014 to identify the forest areas present along the Phase-I roads under TNRSP-II PPC03.

The baseline environmental status is presented in the following six environmental attributes:

- Air Environment
- Land Environment
- Water Environment
- Noise Environment
- Biological Environment
- Socio- economic and Health Environment

4.2. Study Area

To study the baseline environmental profile of the project area, the project impact zone has been classified in to two:

Direct Impact Zone (DIZ): This consists of the RoW and a strip of land within 50 m on either side of the RoW of the proposed alignment. Detailed inventory of environmental features has been carried out in this zone.

Indirect Impact Zone (IIZ): This consists of a strip of land within 10 Km aerial distance on either side of the proposed RoW. The presence of sensitive environmental features specifically mentioned in Section III of Annexure I (Form I) to the EIA Notification 2006 was identified in this zone.

The project corridors falls in two districts namely Salem and Namakkal in the State of Tamil Nadu.

Namakkal district is a newly formed district from Salem district. It came in to existence on 01.01.1997. The district is bounded by Salem on the north, Karur on the south, Trichy and Salem on the east and Erode on the West. Namakkal district is situated at 11^{0} 00' and $12^{\circ}00$ ' of the North latitude and 77° 40' and 78° 05' of the East longitude.

Salem District is one of the biggest districts in Tamil Nadu. It is bounded on the North by Darmapuri district, on the South by Namakkal and Erode districts, the Western Ghats in the West and on the East by Villupuram district. District is situated at 11° 14' and 12° 53' of the North latitude and 77° 44' and 78° 50' of the East longitude.

4.3. Data Sources

Recent data on baseline environment component were collected from various sources of government departments, District and Taluk offices, literature and publications, websites etc. The general information of each district was collected from district hand book and their official websites. Details regarding the ground water were obtained from the reports of Central Ground Water Board. All meteorological data such as rainfall, temperature, relative humidity, wind speed and wind direction were collected from IMD, Pune. Baseline environmental monitoring programme for various environmental attributes was conducted during February-Mach, 2014 and the details thereof is presented in subsequent sections. Baseline environmental monitoring was conducted as per the guidelines of CPCB. NABL accredited and MoEF&CC approved, Aqua Designs India Pvt. Ltd., Chennai and Chennai Testing Labs, Chennai have conducted the baseline environmental monitoring for the project.

4.4. Air Environment – Baseline

Air environment is relatively free from pollution along the project road traversing through agrarian rural and small semi urban areas. As a part of the Environmental Impact Assessment (EIA), climatic component has been studied to establish the benchmarks to understand air quality in the project influence area.

4.4.1. Meteorological Factors and Climates

Climate: Among all other physical factors, climate is the most important factor-influencing environment because it plays a vital role in determining the evolution of landforms (erosion, soil characteristics), types of flora and fauna (ecological diversity), the productivity of ecosystems as well it has an influence on the pollution loads on the environment. Rainfall, temperature, and winds are the principal climatic components that serve to transport, disperse various forms of pollution into the atmosphere and on the ground.

India Meteorological Department (IMD) is the nodal agency responsible for monitoring and recording the climatic parameters. Long-term climatic data were obtained for the project districts to establish a general trend. Monthly average data for 30 years (1971-2000) were considered for analyzing the climatic variables like temperature, humidity and wind speed. Rainfall, the most critical climatic variable was analysed for its long-term trend (50 years; 1941-1990) and also for the recent phenomena (2008-2012).

Both Salem and Namakkal districts experience semi-arid tropical climate wherein four distinct seasons viz., South west monsoon (June – Sep.), North East monsoon (Oct – Dec.), winter season (Jan. – Feb.) and summer season (April – May) are experienced.

Temperature: Temperature pattern for Namakkal and Salem districts are shown in **Table 4.1** and **Table 4.2**.

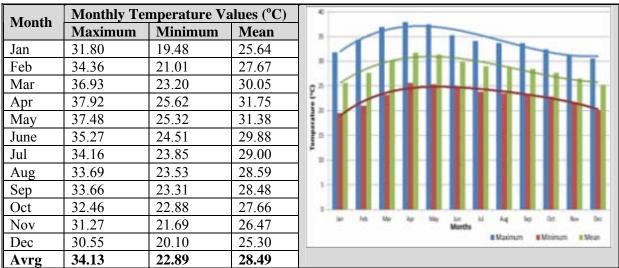

Table 4.1.Temperature Profile of Salem District

Source: Data Collected from IMD, Pune

Table 4.2.	Temperature Profile of Namakkal District
1 abic 4.2.	remperature r rome or ramaxkar District

Source: Data Collected from IMD, Pune

Maximum temperature recorded in the months of March-May and minimum temperature recorded in the months of November to February at both Salem and Namakkal. The monthly mean temperature varies from 20.0 to 26.0 degrees at Namakkal, whereas the monthly mean temperature varies between 25.0 to 32.0 degrees at Salem.

Rainfall: Rainfall at Salem district is moderate. Rainfall in Salem district is for the period of 2008-12 presented in **Table 4.3**. The average rainfall for the first 5 years (2008-12) works out to 1049.64 mm, which is higher than the State average of 943 mm. However, the long term average rainfall for Salem is only 898 mm. No. of average rainy days per year is 52. The north east monsoon period is the major rainy season accounting for 36% of the normal rainfall, followed by southwest monsoon (45%).

Source: http://www.imd.gov.in/

Namakkal is one the dry district of Tamil Nadu state and is one of the six districts in the state receiving less than 800 mm annual rainfall on an average. The average rainfall at Namakkal district for a period of 2008-12 works out to 758.2 mm, which is lower than the State average of 943 mm. The long-term average rainfall for Namakkal is 776 mm. The average rainfall days in a year is 44mm. The

northeast monsoon period is the major rainy season accounting for 41% of the normal rainfall, followed by southwest monsoon (37%). Rainfall in Namakkal district for a period of 2008-12 is presented in **Table 4.4**.

	Monthly	Rainfall (i	in mm) at	Namakkal	District	
Month	2008	2009	2010	2011	2012	Monthly Average

Table 4.4.	Monthly Rainfall in Namakkal District

Source: http://www.imd.gov.in/

January to March is dry period for both the districts. Highest rainfall is receiving in the North East Monsoon than the South West Monsoon.

Relative Humidity: The nature and characteristics of the pollutants will vary with change of the humidity in the atmosphere. Fog provides possibility for suspended particles to coalesce and enhances chemical reaction of the gaseous pollutants.

 Table 4.5.
 Comparison of Average Monthly Relative Humidity of the Project District

Source: Data collected from IMD, Pune

In general, Namakkal district records higher relative humidity due to the hill areas surrounding the district. Relative humidity variation between day and night are higher resulting in higher probability of pest and disease incidences. The highest humidity recorded in the month of October which is 81.1% and the lowest humidity recorded in the month of March, which is 52.41%.

In Salem district, relative humidity is high during the south west monsoon period and generally moderate in the rest of the year. But on an average the relative humidity is low at Salem compared to that of Namakkal. The humidity in the summer afternoons is comparatively very low. The highest humidity recorded in the month of October ($\sim 71\%$) and the lowest in the month of Mar ($\sim 46\%$).

Wind Speed:

Wind speed and wind direction have a significant role on the dispersion of atmospheric pollutants and therefore, the air quality of the area. Ground level concentrations for the pollutants are inversely proportional to the wind speed in the down wind direction, while in upwind direction no effect will be observed and in cross wind direction partial effect due to the emission sources is observed.

Month	Wind Speed (Km/hr)	
WIOITUI	Salem	Namakkal
Jan	3.85	6.08
Feb	3.85	5.96
Mar	4.25	6.84
Apr	4.44	6.76
May	3.77	7.64
Jun	4.36	11.6
Jul	4.06	11.29
Aug	3.72	10.37
Sep	2.79	7.38
Oct	2.45	5.91
Nov	2.81	5.15
Dec	3.4	7.95

 Table 4.6.
 Comparison Average Monthly Wind Speed of the Project Districts

In Namakkal district, during October to March, wind blows generally from North Easterly and Easterly directions. South westerly and westerly winds predominate from May to September. The wind speed is least in October to February, while it is higher from July to September.

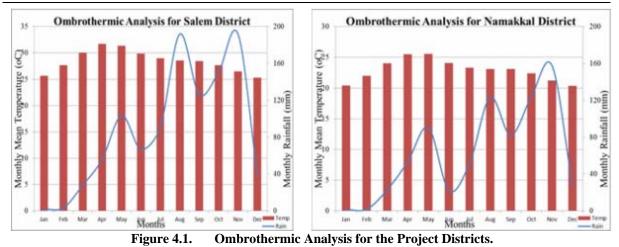

Winds are generally light to moderate with some strengthening in monsoon season in Salem district. The region is influenced by winds from south-west and north-west during the period from May to September and from north-east and south-east during the period from October to April.

Ombrothermic Analysis: Water balance is one of the main environmental conditions that influence the vulnerability of a region to climate change. Ombrothermic analysis uses two indicators – precipitation (ombro) and temperature (thermic) – to assess the spatial extent of vulnerability of a region to climate change. Ombrothermic analysis uses humidity/aridity indices and graphics to integrate temperature and precipitation data over time. Using readily available temperature and precipitation data, the method produces graphics and maps that can identify vulnerable areas that may be prone to humidity (excessive rainfall) or aridity (drought). Also this analysis helps to identify the wet and dry months at a region.

The ombrothermic graphs for Salem and Namakkal districts are given Figure 4.1.

Project Preparation Consultancy Services for preparing Detailed Project Report (DPR) for various road improvement works under Tamil Nadu Road Sector Project II (TNRSP II): Contract PPC03

4.4.2. Ambient Air Quality

Ambient air quality refers to the background air quality levels in a region, characterised by concentrations of various pollutants in the atmosphere. The presence of air pollutants and their concentrations depends on the type of polluting sources, and other factors that influence their flow and dispersion. In most cases vehicular emissions are the predominant source of air pollution. Existing ambient air quality data on various sections of the project corridors was collected to establish a baseline database. The aim was to identify areas that already have high pollution levels or are expected to experience so, on account of the road project, and to design adequate mitigation measures, as applicable.

The activities, which modify atmospheric air quality are transportation (i.e., motor vehicle emissions, which are addressed in this study); industry; domestic and construction. The major pollutants of significance to roadside air quality, on account of vehicular emissions, are Fine Particulate Matter (PM_{2.5}), Respirable Particulate Matter (PM₁₀), Sulphur dioxide (SO₂), Nitrogen oxides (NOx), and Carbon monoxide (CO).

No secondary data on air quality for the Phase-I roads under TNRSP-IIwas available for the Namakkal & Salem districts. However, Tamil Nadu Pollution Control Board has published the annual mean concentration of air pollutant level for SO₂, NO₂ and RSPM for the year 2004. Monitoring was conducted at Sowadswari Collect building, a residential area in Salem town. The result shows that, the air quality parameters are falling within the NAAQ Standards.

Ambient air quality along the project roads is generally good in condition due to the absence of any major industries near to the project corridors. The project envisages improvement of project roads which will ease the traffic flow reducing emission of air pollutants. Since project roads generally pass through agricultural lands, it is not expected to have any negative impact on air quality. Further, the topography of the project influence area support dispersion of pollutants to a great extent.

Ambient Air quality monitoring was conducted along the project roads as part of baseline environmental monitoring. The prime objective of the baseline air quality study is to establish the existing ambient air quality of the study area. This will be useful for assessing the conformity to standards of ambient air quality during construction and operation phase.

Monitoring locations: Factors that modify emission of air pollutants are traffic features (volume, speed, composition and mode), vehicle maintenance levels, road geometry and areas of congestion. To assess the ambient air quality along the project corridors, ambient air quality monitoring was carried out at identified locations. The monitoring locations were selected based on the sensitivity of the receptors to vehicular traffic and to obtain baseline concentrations of the various representative land uses along the corridors. Locations of the monitoring stations are presented in **Table 4.7**.

Sl. No	Name of the Location	Monitoring Locations & Environmental Setting
Tiruc	hengode to Paramath	y Section of Road No. 2 (SH 86)
1	Meenkinar	At Km 57+200, Main land use is agriculture and rural settlements
2	Kandampalayam	At Km 65+000, commercial center, Govt. HSS and Govt. PHCs are proximity to the location, high traffic during peak hours
3	Mavureddy	At Km 79+000, residential area proximity to Paramathy town with medium traffic.
Malli	yakarai to Rasipuram	Section of Road No. 4. (SH 79)
1	Malliyakarai	At Km 0+200, rural settlement with medium traffic and District Primary Heath Center is close to the location.
2	Mangalapuram	At Km 14+000, mainly commercial area, proximity to Govt. High School, culturally significant structures and small scale industries
3	Near Bailnadu RF	At Km 24+400, mixed land use i.e. near to Reserved Forest.
Rasip	uram to Tiruchengod	e Section of Road No. 4. (SH 79)
1	Koppanpatti	At Km 51+800 at residential area with medium traffic
2	Vaiyappamalai	At Km 54+600, near to Govt. HSS, major settlement with heavy traffic
3	Elachipalayam	At Km 62+500, near commercial area surrounded by scattered settlements
Moha	nur to Namakkal Sec	tion of Road No.5 (SH 95)
1	Mohanur	At Km 0+600, near to bus stand, Mohanur, major settlement with heavy traffic
2	Aniyapuram	At Km 9+900 near to Arumugham Udaiyar Govt. Higher Secondary School, Aniyapuram, Rural settlement
3	Near Veterinary University	At Km 12+400 near to Tamil Nadu Veterinary & Animal Science University, surroundings are characterized by a number educational institutions

Table 4.7.	Details of Ambient Air Quality Monitoring Locations

Table 4.10. Ambient Air Quality along the Phase-I roads under TNRSP-II

Source: Baseline Environmental Monitoring done by Chennai Testing Labs, Chennai and Aqua Design, Chennai

4.5. Land Environment – Baseline

The land environment describes the baseline aspects of the nature and geomorphic features, soil conditions and quality, borrow and material resources and land use characteristics. Portion of this section has analyzed role of these landscape features in road improvement.

The components of land environment discussed in this section includes,

- Geography and Topography
- Geology and Minerals
- Soil Characteristics
- Land Use
- Landslide / Landslip Problem
- Agriculture

4.5.1. Geography and Topography

The northern portion of Namakkal is mountainous and the southern areas are plains. The plain area of the district can be divided into 3 elevation stages. The lower elevation (below 150 m) has Namakkal and Paramathy taluks which are being benefited by Cauvery River. The mid elevation (150-300 m above M.S.L.) occupies the major area in all taluks. The high elevation area are the Kollimalai range, with peaks 1219 m, spreads over mainly in Rasipuram and Namakkal taluks. The average altitude of the district is 300 m above MSL.

Salem district is one of the largest districts in Tamil Nadu. The elevation of landscape generally ranges from 150 m to 400 m above MSL with the exception of Yercaud, which is at 1500 m above MSL.

Salem district is intersected by numerous hills. Shervroy Hills and Kalrayan Hills adorn the district with natural beauty and forest wealth. The district forms part of the upland plateau region of Tamil Nadu with many hill ranges, hillocks and undulating terrain with a gentle slope towards east. The prominent geomorphic units identified in the district through interpretation of satellite imagery are 1) Plateau, 2) Structural hills, 3) Bazada zone, 3) Valley fill, 4) Pediments, 5) Shallow Pediments and 6) Buried Pediments.

Topographically project region is plain area with scattered hillock. The relief and slope of the project area is depicted in **Figure 4.2**.

Project Preparation Consultancy Services for preparing Detailed Project Report (DPR) for various road improvement works under Tamil Nadu Road Sector Project II (TNRSP II): Contract PPC03

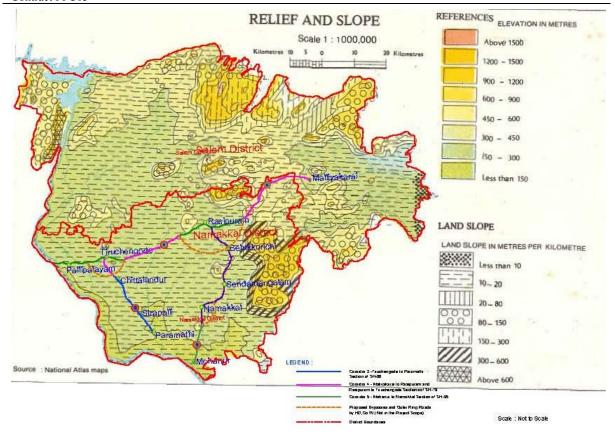

Figure 4.2. Map of the Project Districts showing the Profile of Relief and Slope.

The Phase-I roads under TNRSP-II are passing through mainly plain and rolling terrain. Graphical representation of elevation profile of the project corridors are depicted in **Figure 4.3** to **Figure 4.6**. The Tiruchengode to Paramathy Section of Road No. 2 (SH 86) and Malliyakarai to Rasipuram section of Road No. 4 show the highest variation in elevation along the project stretch. Rasipuram to Tiruchengode section of Road No. 4 and Mohanur to Namakkal section of Road No 5 are relatively plain stretches.

The Tiruchengode to Paramathy section of Road No. 2 is having very dropping elevation profile, with the highest elevation of the project road 245 m at the beginning (Pulliyampatti) and 138 m at the end point (Paramathy), giving a drop of 113 m for the project stretch.

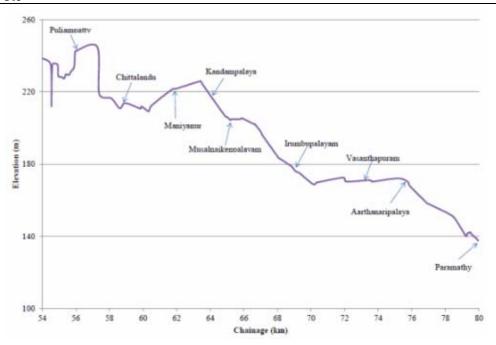

Figure 4.3. Elevation Profile of Tiruchengode to Paramathy Section of Road No. 2.

The Malliyakarai to Rasipuram section of Road No. 4 is having very undulating elevation profile. The stretch is having elevation profile of triangular shape with the starting point (Malliyakarai) and the end point (Namagiripettai) having elevation ~276 m, whereas the highest elevation is at reserve forest locations, 418 m. So, the stretch is having a rise and drop of 142 m within a length of 32.6 Km.

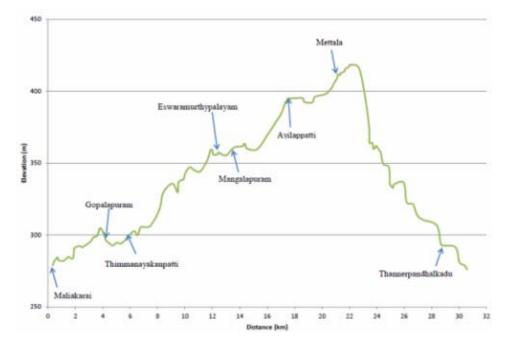

Figure 4.4. Elevation Profile of Malliyakarai to Rasipuram Section of Road No.4

Comparatively, Rasipuram to Tiruchengode section of Road No. 4 is having level profile, but having lots of ups and downs through the project stretch. The maximum drop in elevation, within the project stretch is only 47 m, the highest elevation being 231 m, and the lowest elevation 184 m (at Elachipalayam).

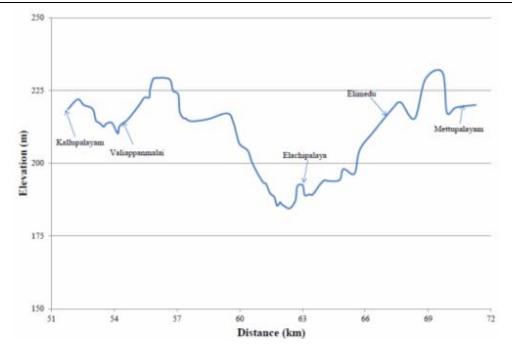

Figure 4.5. Elevation Profile of Rasipuram to Tiruchengode Section of Road No. 4

The Mohanur to Namakkal Section of Road No.5 is having a rising elevation from 121 m (Mohanur) to 197 m (Lathwadi), thus having an elevation difference of 76 m within the project stretch.

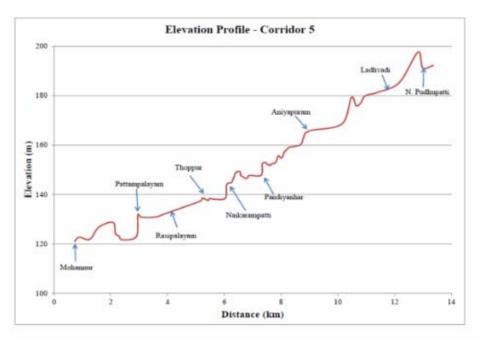

Figure 4.6. Elevation Profile of Mohanur to Namakkal Section of Road No. 5

4.5.2. Geology and Mineralogy

Namakkal district consists of mainly black and multi-color granite, Charnockite and Limestone rocks. The mineral deposits in the district include Bauxite, Quartz, Feldspar, Platinum and manganese. Recently, Geological Survey of India has found platinum prospects in Namakkal district. The predominant geological formations of Namakkal district are Alluvium, Colluvium, Laterite, Granite, Dolerite, Quartzite, Charnockite and Granite Gneiss.

A major part of the mineral wealth of the Tamil Nadu is confined to Salem District, where a variety of important minerals like Magnesite, Dunite, Bauxite, Limestone, Iron ore, Quartz, Feldspar and Soapstone, Granites etc., are found. There are 83 Major minerals mines, 108 black & colour granite quarries and 35 rough stone quarries in Salem District.

The predominant geological formations of Salem district are Alluvium, Colluvium, Laterite, Granite, Dolerite, Quartzite, Charnockite and Granite Gneiss. Salem district finds very important place in the rocks & mineral map of Tamil Nadu. Bauxite, Dunite, magnetite, quartz, limestone, soapstone and granite are important minerals available in the district.

The Phase-I roads under TNRSP-IIare passing through rich rock deposit areas in the project districts. This needs blasting or mechanical drilling for the proposed project improvements. **Figure 4.7** reveals the rocks and minerals along the project corridors.

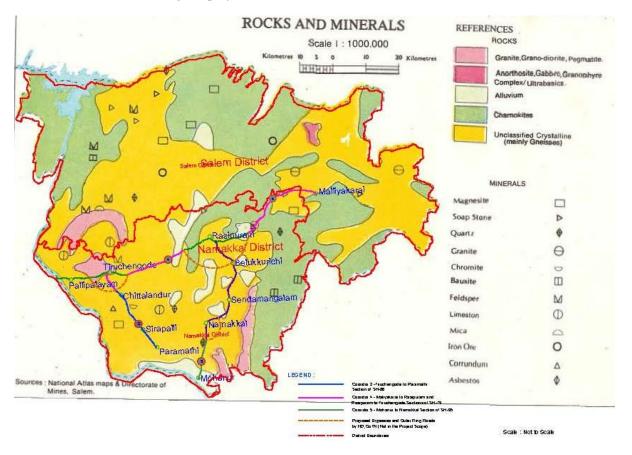

Figure 4.7. Map of the Project Districts showing the Profile of Rocks and Minerals

Seismicity and Volcanic Activity: Seismicity / Effect due to earthquake has been accounted for by considering the seismic load in longitudinal and transverse direction. For the purpose of determining the seismic forces the country is divided into four zones (Zone II to Zone V) based on the intensity of earthquakes that a particular area may be subjected to, with Zone V comprising of areas which have been subjected to severe earthquakes & Zone-II comprising areas least liable to earthquakes (source: http://www.imd.gov.in/section/seismo/static/seismo-zone.htm). The seismic loads are calculated using Response Spectrum method as per Modified clause of IRC 6: 2010. The seismic force depends upon

several factors like zone factor, Period of vibration, Soil type etc. The seismic load in longitudinal and transverse direction is found out separately. As per the seismic zone classification of India, the project districts fall in zone III & zone II, i.e. moderate and least active categories. The Project site falls in both Zone II & III of seismic map (**Figure 4.8**) and relevant provisions in IRC-6:2010 have been adopted in the design.

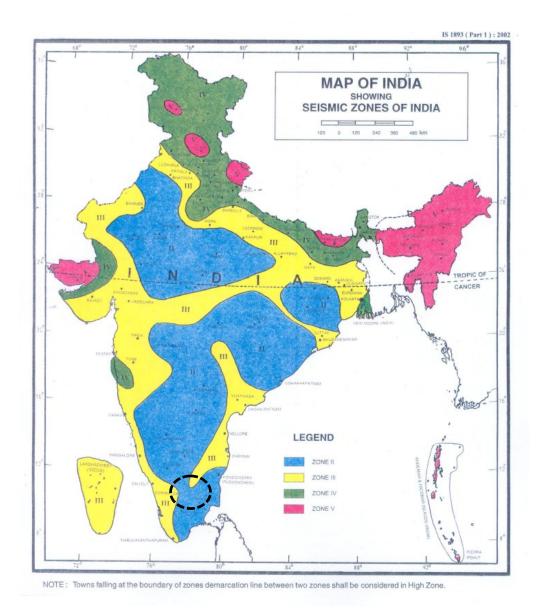

Figure 4.8. Map showing Seismic Zones of India

The whole project area falls in the vast volcanic basalt beds of Deccan plate, which formed towards the end of Cretaceous period, between 65 and 67 million years ago. There is no recent seismic and volcanic activity reported along the project area.

4.5.3. Soil Characteristics

The soils of the Namakkal district can be classified under 6 categories viz., Red loam, Lateritic, Black, Sandy Coastal alluvial, Red sandy and Clay loam. The block wise distribution of soil is presented in **Table 4.11**.

Sl. No.	Type of Soil	Blocks in Namakkal District
1.	Red loam	Namakkal, Elachipalayam, Puduchatram,
		Mallasamudram, Rasipuram, Tiruchengode, Paramathy
		and Parts of Pallipalayam.
2.	Lateritic soil	Kollihills
3.	Black soil	Erumapatty, Kabilarmalai, Mohanur, Namagiripet and
		Parts of Pallipalayam.
4.	Sandy coastal alluvial	Kabilarmalai
5.	Red sandy soil	Puduchatram
6.	Clay loam	Sendamanalam, Vennandhur, Erumapatty

 Table 4.11.
 Soil Types and their Distribution in Namakkal District

Source: Office of the Joint Director of Agriculture, Namakkal

It could be seen from the table that majority of the area in the district is covered by red loamy soil followed by the black soil and clay loam. The red loamy soils are suitable for cultivation of crops under both rain fed and irrigated conditions. The lateritic soils which are little acidic in nature is found in the Kolli hills region of the district. The soil is suitable for cultivation of some fruit crops and plantation crops like Cardamom in the higher reaches. Sandy coastal alluvial soil is found adjoining the river and canal irrigated areas in the Kabilarmalai block. The red sandy soil dominates the Puduchatram block.

The soils in Salem district can be broadly classified into 6 major soils types viz., Red *in-situ*, Red Colluvial Soil, Black Soil, Brown Soil, Alluvial and Mixed Soil. Major part of the district is covered by Red insitu and Red Colluvial soils. The soil distribution in the taluks of Salem district is given in the **Table 4.12**.

Table 4.12.Soil Types and their Distribution in Salem District

Sl. No.	Type of Soil	Blocks in Salem District
1.	Black soil	Salem, Attur, Omallur, Sankari
2.	Brown	Yercaud, Salem, Omallur
3.	Alluvial	Omallur, Sankari

Source: Office of the Joint Director of Agriculture, Salem

Soils profile of the PIA of Phase-I roads under TNRSP-IIare varying from are Red soil, Black soil Brown soil to Mixed soil. **Figure 4.9** gives the details of soil types found along the project road.

Project Preparation Consultancy Services for preparing Detailed Project Report (DPR) for various road improvement works under Tamil Nadu Road Sector Project II (TNRSP II): Contract PPC03

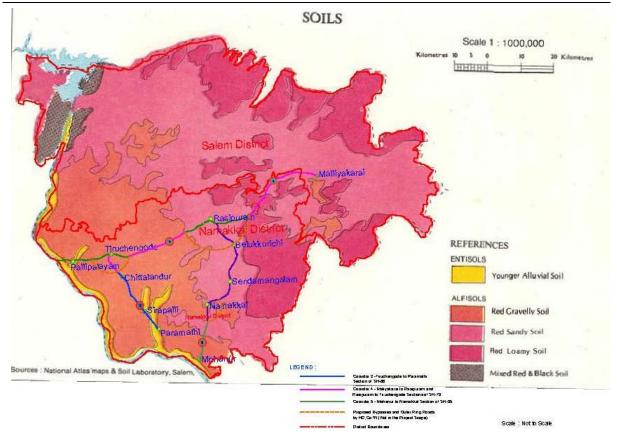

Figure 4.9. Map of Project Districts Showing the Soil Types

In order to have a better understanding of soil characteristics of the project area, soil samples were taken and analysed for all important parameters at pre-selected locations. Soil sampling locations for the Phase-I roads under TNRSP-II are presented in **Table 4.13**. Results of the soil sample analysis are presented in **Table 4.14**.

Name of the Location	Monitoring Locations & Environmental Setting
hengode to Paramathy Second	ection of Road No. 2 (SH 86)
Meenkinar	At Km 57+200 near to the start point, main land use is agriculture and rural settlements
Kandampalayam	At Km 65+200, busy settlement along the project corridor characterized by commercial activities
Mavureddy	At Km 79+600 near to the end point, mainly residential area
yakarai to Rasipuram Se	ction of Road No. 4. (SH 79)
Malliyakarai	At Km 0+200 near to DPH, rural settlement, surrounded by dense scrub forest and cultivated lands
Mangalapuram	At Km 14+000, a medium settlement characterised by commercial activities.
Near Bailnadu RF	At Km 24+600, rural settlement with agricultural lands. Reserve Forests are proximity to the location

4.5.4. Land Use

The geographical area of Namakkal is only about 62% of that of Salem. The major land use of Namakkal district is agriculture (sown area) which consists of 51.63 % of total geographical area. forest (16.33 %) and current fallows (12.69 %) are the next major land uses in Namakkal

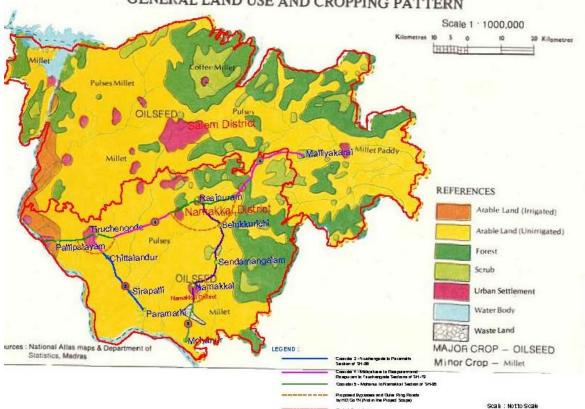

The major land use of Salem is agriculture land (sown area), which consist of 40 % of total area. The next major land uses are forestland (24.2 %) and current fallows (11.1 %).

The land use pattern in Salem and Namakkal districts is furnished in **Table 4.15**

Sl.	Classification	Area in ha (% of to	ha (% of total area)		
No.		Namakkal	Salem		
1	Forest Land	52717 (16.33 %)	125682 (24.2 %)		
2	Barren and uncultivable lands	13475 (4.17 %)	38894 (7.5 %)		
3	Land put to non-agricultural uses	28709 (8.89 %)	60972 (11.5 %)		
4	Cultivable Waste	7815 (2.42 %)	4947 (1.0 %)		
5	Permanent pastures and other grazing lands	2487 (0.77 %)	4200 (0.8 %)		
6	Land under misc. tree crops and groves	2248 (0.69 %)	2936 (0.6 %)		
7	Current fallows	40962 (12.69 %)	57824 (11.1 %)		
8	Other fallow lands	7646 (2.36 %)	16949 (3.3 %)		
9	Net area sown	166577 (51.63 %)	208126 (40.0 %)		
10	Total geographical area	322636 (100 %)	520530 (100 %)		

Table 4.15. **Comparison of Land Use Types in Project Districts**

Source: http://advanceagripractice.in/location/

GENERAL LAND USE AND CROPPING PATTERN

Figure 4.10. Map Showing Landuse Patterns in Project Districts Major land use along all the Phase-I roads under TNRSP-II is agricultural land. Land use pattern for Tiruchengode to Paramathy Section of Road No. 2 includes agriculture (63.83%) and settlement (36.17%). For Road No.4, in Section I - Malliyakarai to Rasipuram, the land cover includes mixed land use dominated by agriculture (71.97%), followed by settlements (23.97%), Forest areas (2.95%) and open area (1.31%) and in Section II - Rasipuram to Tiruchengode, consists of agriculture (82.41) and settlement (17.59). Mohanur to Namakkal section of Road No.5 is dominated by settlement (52.60%) followed by open land (28.57%), agricultural land (16.88%) and forest land (1.95%). Map of the project area showing general land use and cropping pattern is presented in **Figure 4.11**.

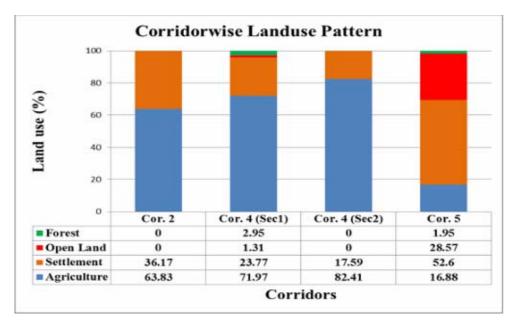

Figure 4.11. Comparison of Landuse Patterns in Phase-I roads under TNRSP-II

Occupational profile and sources of employment: The reconnaissance survey shows that, most of the affected/benefited families are running business and others are agriculturalists. Major occupation of people in the project area is agriculture. Poultry and manufacturing sago products are other two major source of employment along the project corridors.

4.5.5. Landslide / Landslip Problems

Major soil erosion, landslide or landslip problems are not reported from any part of the project area, since major parts of the project corridor are passing through plain terrain and also the rainfall of the project area is very less.

4.5.6. Agriculture

The most prominent land use along the project road is agriculture (70%) and this area falls in agroclimatic zone of eastern and central dry zone.

The major field crops of Salem district are Sorghum, Maize, Paddy, Groundnut, Sugarcane and cotton. The major horticulture fruits are Tapioca, Mango, and banana and major vegetables are Tomato, Chilli and Brinjal. The major plantation crops of Salem are coffee and arecanut.

The principal cereal crops along the Phase-I roads under TNRSP-II are paddy, cholam, cumbu and ragi. Panivaragu, Kuthianally, Samai Varagu and Thinai are some of the millets cultivated. Among

pulses, the major crops are redgram, blackgram, greengram and horsegram. Among oil seeds groundnut, castor and gingerly (sesame) occupy important places. Of the commercial crops, sugarcane, cotton and tapioca are some of the important crops. Tapioca is used for the manufacture of sago.

A variety of fruits like mango, tamarind, guava & sapota and vegetables like tomato, brinjal, cabbage, chilies, etc.& flowers such as chrysanthemum, are cultivated along the project corridors.

4.6. Water Environment – Baseline

4.6.1. Hydrology

The Namakkal district is falling in part of east flowing Cauvery and Vellar river basins as per the Irrigation Atlas of India. Tirumanimuttar, Vasista and Sweta are the important minor basins.

Cauvery river, which is perennial in nature, flows along the western and southern boundaries of the Namakkal district. Tirumanimuttar river, has its origin in Manjavadi area of Shevroy hills in Salem district and confluence with Cauvery at Nanjai Edayar village of Paramathi taluk. A small area in the northeastern part, which is drained mainly by Vasista Nadi and Sweta Nadi rivers, which are tributaries of Vellar River.

The source of Irrigation is wells, canals and tanks. Well irrigation is the main source of irrigation covering 71272 ha. An area of 8868 ha is covered by Canal Irrigation. Other sources of irrigations like lift irrigation and odai are 6512 ha. There are nearly eighty thousand wells and eight thousand bore wells in Namakkal district. Among the taluks, Namakkal taluk seems to have exploited most of the ground water potential compared to the other three taluks and the net area irrigated is also the highest in this taluk. Canals are lined canals running across its territories and the total canal length is about 75km.

There are four canals ie, Mettur canal, Raja Vaikkal, Mohanur Vaikkal and Kumarapalayam. The four canals pass through three taluks and four blocks. Among the canal ayacut area, the area covered by the Mettur canal is the largest and Mohanur Vaikal is the smallest.

Salem district is drained by tributaries of Cauvery and Vellar rivers. Cauvery river, which is perennial in nature, flows along the western and southern boundaries of the district. Sarabanga and Tirumanimuttar are important tributaries of Cauvery river and originate in the Shevroy hills. The Swetha and Vasishta rivers are tributaries of Vellar river. The Swetha river originates in the Kollimalai and flows eastwards and joins the Vellar river. The Vasishta river originates in the chitteri hills and flows southwards and joins the Vellar river. In general, the district is characterized by dentritic drainage.

Major source of water for irrigation in Salem district is Cauvery River, which supplies water for 0.15 ha of agricultural land. Salem district is not endowed with any major irrigation system except Mettur Dam which irrigates about 0.15 lakh hectares through the West Bank canal of the Cauvery. Wells are the main source of irrigation in Salem district which constitutes about 97 percent of the total area under irrigation; both net and gross irrigated area. The irrigation intensity is 82 percent.

Phase-I roads under TNRSP-II passes through rivers, canals and streams, and abuts a number of lakes, ponds and bore wells, open wells and water taps. Corridor wise list of water bodies abutting/crossing project roads are presented in **Table 4.16**.

Sl.	Name of the Water	Position w.r.to	Existing	Distance	Crossing /

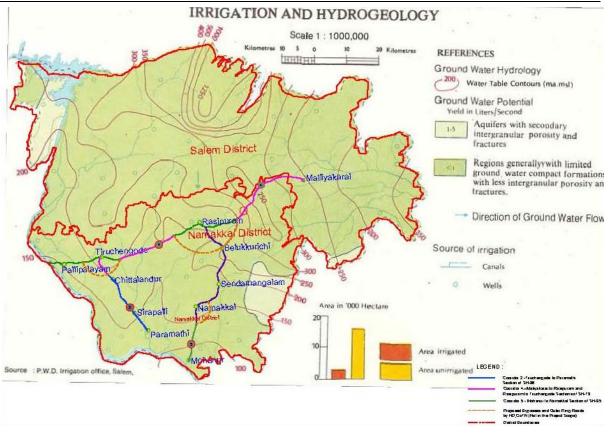

Figure 4.12. Map Showing Irrigation and Hydrogeology of the Project Area

4.6.2. Drainage Conditions / Issues

In rural areas, the existing side drainage varies with terrain and road reserve width. On plain terrain, some sections have been constructed to generous reserve width and side drains are well-back from the road center line.

In urban and semi-urban areas, there is extensive use of concrete section of rectangular channel drains, either open or covered where vehicle or pedestrian access is required. In most cases there is no kerb and channel at the pavement edge and water runs off directly into the side drains. Alternatively, where kerb and channel is provided, water is led off to the side drains at intervals through kerb inlet and channel.

The most common drainage defects observed are:

- Absence of side drains and ponding of water at the road side in both urban and rural areas;
- In some instances, there is inadequate width between neighboring property and the road edge to construct effective side drainage;
- Poor grading of the shoulder and side-slopes, allowing water to channel and scour along the road edge and to flow across the road instead of running off into the side drains;
- In urban areas, blocked or broken drainage channels and various obstructions to runoff.

4.6.3. Surface and Ground Water Quality

No detailed secondary data available to assess the water quality of the surface water bodies. From the visual observation, water quality of the lakes and ponds are seems to be below standard, as these water bodies are polluted by draining of sewage from nearby settlements and unscientific dumping of solid waste.

Ground water in Namakkal district is in general colourless, odorless, and predominantly alkaline in nature. A study conducted by Central Ground Water Board indicates that only some place of the district, the ground water is suitable for drinking and domestic uses. Excess of fluoride is observed in many places such as Venandur, Udaiyarpalayam, Talamabadi, V.G.Patti and Mohanur. The study by CGWB reveals that the ground water of Namakkal has higher than permissible levels of Ca CO₃, NO₃, and F.

In Salem district, the studies conducted by CGWB indicate that ground water is in general colourless, odorless and slightly alkaline in nature. However, it is observed that ground water is characterized by higher concentration of NO₃, SO₄, and F than the BIS permissible limit.

The project roads are passing through Attur block of Salem district and Elachipalayam, Kabilar malai, Malla Samundaram, Mohannur, Namagiripettai, Namakkal, Paramathy, Puchudhitram, Rasipuram and Tiruchengode blocks of Namakkal district. The ground water development status of these blocks and the districts in whole are given in the **Table 4.17**.

 Stage of Ground Water Development in Project Areas as on March 2004 (in Ham)

Source: District Ground Water Brochure for Namakkal and Salem districts, Central Ground Water Board

The baseline status of surface and ground water quality along the project roads has been established through sampling and analysis of various water quality parameters as part of the baseline environmental monitoring conducted by the Consultants. The sampling locations were selected at

representative locations based on existing land use and type of water body. The details of the same are presented in **Table 4.18**. Sampling for water quality monitoring was conducted at all the locations once during February 2014. The surface water samples were collected and analysed as per the procedures specified in IS: 2296 and ground water samples were analysed as per the procedures specified in IS: 10500.

Table 4.18.	Details of Water Quality Monitoring Locations
--------------------	--

Note: GW = *Ground Water, SW* = *Surface Water*

The prime objective of the baseline surface and ground water quality study was to establish the existing water quality of the study area to evaluate the anticipated impact of the proposed project and to suggest appropriate mitigation measures for implementation. This will also be useful for assessing the conformity to the standards of surface water quality during the construction and operation phase of the project.

The monitoring results for surface water quality and ground water quality are presented in Table 4.19.

For Tiruchengode to Paramathy section of SH 86, monitoring results reveals that, ground water in the project region is slightly alkaline where pH value is varies from 7.3 to 8.3. TDS, total hardness (CaCO₃), Chloride, Calcium, Magnesium and Nitrate values in Thottiyapalayam are exceeds the IS:10500 standard. Ground water parameters of remaining locations are falling within the permissible limits of IS: 10500 standard.

For Malliyakarai to Rasipuram and Rasipuram to Tiruchengode sections of SH 79, monitoring results reveals that, ground water in the project region is neutral in nature. For Total Hardness (CaCO₃), except in GW2, remaining all samples exceeds the permissible limits of IS 10500. Magnesium is beyond the limits in GW3, GW4, GW6 & GW7 and Nitrates exceed the limit in GW1, GW5, GW6 and GW8. Total dissolved Hardness exceeds the IS:10500 standard in GW6, GW7 and GW8. Ground water parameters for remaining locations are falling within the permissible limits of IS:10500 standard.

For Mohanur to Namakkal section of SH 95, Monitoring results revels that, Surface and Ground water parameters are falling within the permissible limits of IS:2296 & IS:10500 standard

4.6.4. Coastal and Marine Resources

Salem and Namakkal districts are land-locked districts and away from coastal line. Hence, coastal and marine resources are not present in these districts.

4.7. Ambient Noise – Baseline

Noise from the vehicle body parts includes engine, inlet, exhaust, transmission, suspension, gearbox, cooling fan, during acceleration and chassis, etc. Vehicle condition is very important to the source of noise and extent. The rolling noise/frictional noise (noise from the tyre-roadway system) includes aerodynamic noise, noise from tyre-road interaction, brakes, etc. The noise level depends upon on the type and condition of tyres and pavement. At higher speed, these types of noise increase at same rate. At lower speeds in urban areas, where lower gears are used, noise from the vehicle body parts tends to be independent of vehicle speed whereas noise from the tyre-roadway system becomes less important. Driver behavior contributes to road noise by using vehicle's horns, sudden breaking on vehicle speed, depending on the road surface and whether the surface is wet or dry.

4.7.1. Ambient Noise Level

Noise in general is unwanted / undesired sound, which is composed of many frequency components of varying loudness distributed over the audible frequency range. Various noise scales have been introduced to describe, in a single number, the response of an average human to a complex sound made up of various frequencies at different loudness levels. The most common and universally accepted scale is the A weighted scale which is measured as dB (A). This is more suitable for the audible range of sound, 20 to 20,000 Hz. The scale has been designed to weigh various components of noise according to the response of a human ear. The impact of noise sources on surrounding community depends on:

- Characteristics of noise sources (instantaneous, intermittent or continuous in nature). It can be observed that steady noise is not as annoying as one, which is continuously varying in loudness;
- The time of day at which noise occurs, for example high noise levels at night in residential areas are not acceptable because of sleep disturbance; and
- The location of the noise source, with respect to noise sensitive land use, which determines the loudness and period of exposure.

The environmental impact of noise can have several effects varying from Noise Induced Hearing Loss (NIHL) to annoyance depending on loudness of noise. The assessment of noise is carried out considering various factors like potential damage to hearing, physiological responses, annoyance and general community responses.

It is possible to describe important features of noise for noise levels measured over 24 hours using statistical methods. These features of noise are the parameters used for describing the noise levels at a particular location. Standards for permissible noise levels at various zones are set based on these parameters. The notations used for various noise level parameters are described below.

- L_{eq} Equivalent sound pressure level the steady sound level that, over a specified period of time, would produce the same energy equivalence as the fluctuating sound level actually occurring.
- $L_{eq(1 hr)}$ The equivalent noise level for a specific one hour period.
- $L_{eq(24 hr)}$ The equivalent noise level during a 24 hour period.
- L_{day} The equivalent noise level from 6:00 hours to 22.00 hours.

- L_{night} The equivalent noise level from 22:00 hours to 6.00 hours.
- L_{dn} It is similar to a 24 hr equivalent noise level except that during night time (10 pm to 6 am) a 10 dB(A) weighting penalty is added to the instantaneous sound level before computing the 24 hr average. This night-time penalty is added to account for the fact that noise during night when people usually sleep is judged as more annoying than the same noise during the daytime.

Noise level monitoring were conducted at pre-selected locations based on the land use and presence of sensitive features. The objective of assessing baseline noise levels can be later used to assess the impact of the total noise generated by the proposed project activities. Noise level monitoring carried out continuously for 24 hours with one hour interval at each location during the study period, Hourly L_{eq} values were computed by the noise integrating sound level meter and statistical analysis was done for measured noise levels at the pre-selected locations in the study area.

Vehicular movement is the only source for noise pollution in the project corridors. Ambient noise level monitoring locations for project corridors are presented in **Table 4.23**.

4.8. Flora and Fauna – Baseline

4.8.1. Protected Natural Habitats

There are no protected natural habitats present within 15 Km radius of any of the project roads.

4.8.2. Wildlife Habitats outside Protected Areas

Wild animals like monkeys, can be seen in the forest areas along the project roads. Among the birds, peacocks are common while jungle fowls are also sometimes seen. Among the mammals, mongooses are seen throughout the project area. However, no wildlife corridors are reported across the project roads.

4.8.3. Forest Area

Forest contributes to nearly 13% to the geographical area mainly by the Kollli hills and parts of the Western Ghats that cut across the Namakkal district. Land put to non-agricultural uses are the next highest (11%). The forest area in Namakkal district is about 10.78% as reported in Land Use statistics. Apart from Reserve Forests, Reserve Lands occupy 12.31% of the total forest land.

Malliyakarai to Rasipuram section of Road No.4 is abutting/ Reserved Forest (RF) land at two locations. Pudupatti East Beat RF on RHS (from Km 22+600 to Km 23+900) and Bailnadu RF on LHS (from Km 24+500 to Km 25+000) are abutting the road. Mohnur to Namakkal section of Road No.5 is abutting Saravumalai RF on LHS (from Km 10+700 to Km 11+000). There is no diversion of forest land due to this project. **Figure 4.13** and **Figure 4.14** show the location of reserved forests abutting the project alignments. As per the Champion and Seth's¹ (1968) classification of forests, the forests along the project roads are tropical dry deciduous forests.

¹ Champion H. G. and S. K. Seth. 1968. A Revised Survey of the Forest Types of India. Published by Govt. of India Press.

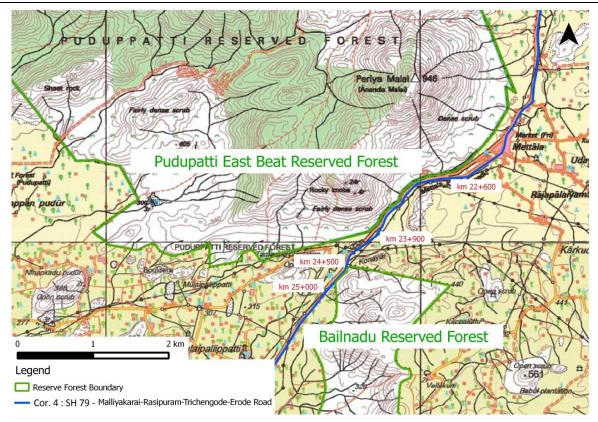

Figure 4.13. Map showing Reserved Forests along Malliyakarai – Rasipuram Road

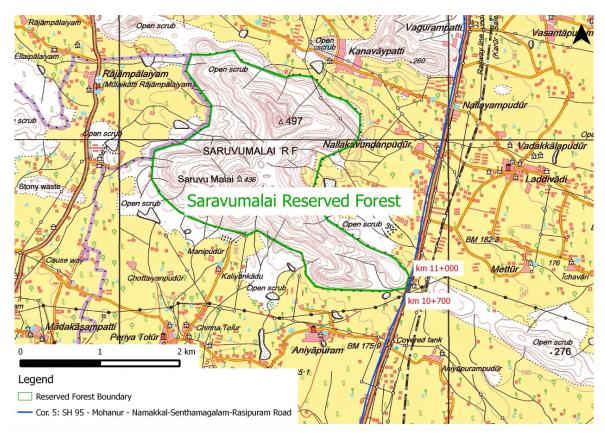

Figure 4.14. Map showing Reserved Forests along Mohanur – Namakkal Road

4.8.4. Flora

List of dominant trees found along the project roads are given in **Annexure 4.1** with their RET status. The baseline study of flora has primarily taken into account the flora along the roadside, as the direct impact of the project is on the trees in the formation width. Chainage wise details of number of trees to be felled for the Phase-I roads under TNRSP-II are presented in **Annexure 4.2**.

4.8.4.1. Green Tunnel

A well maintained avenue plantation on both sides of the Malliyakarai to Rasipuram section of Road No.4 (SH 79) and Mohanur to Namakkal Section of Road No.5 was observed during the reconnaissance survey. Tamarind tree species was found in majority of the avenue plantation. Especially in some stretches which forms a continuous canopy, giving the effect of Green Tunnel. In Malliyakarai - Rasipuram section of Road No. 4, green tunnel observed for a length of about 8.15 Km and in Mohanur to Namakkal Section of Road No. 5, it is observed for 3.00 Km. However, no green tunnel was observed in Tiruchengode - Paramathy section of Road No. 2. Chainage wise details of the green tunnel for the project corridors are given in **Table 4.25**.

Sl. No	From (Km)	To (Km)	Length in Km

4.8.5. Fauna

Annexure 4.1 gives the list of fauna found along the PIA with their IUCN status.

4.8.6. Presence of Vulnerable, Threatened and/or Endangered Species of Flora and Fauna

Among the major flora species found in Salem district are *Crotolaria clavata* and *Crotolaria longipes* are endangered species and *Crotolaria digitata*, *Crotolaria scabra*, *Indigofera barberi* are rare species.

The rare species identified in Namakkal district are *Crotalaria digitata, crotalaria scabra and Indigofera barberi;* and the endangered species identified at Namakkal are crotalaria *Clavata, Crotalaria longipes, Hildegardia populifolia* and *Venonia shevaroyensis.*

4.9. Socio-Economic Environment

Salem is a major centre for Industries, Commerce, transportation, services like education, health, etc. Lorry, bus transport, drilling rigs, heavy earth moving equipment, LPG tankers, and container transport facilities prevailing in Salem city provides sizeable employment opportunities in transport and transport related industries. Sago-Starch product Industries, Silk weaving & cotton textile industries proliferate in the area. Silver smithy and gold smithy are carried out in thousands of cottage industries and the products are exported all over the country. Further, Salem is a major market for rice and dal.

Nationwide Namakkal is known for Body Building for Truck, Trailer, Tanker and Rig unit. Customers from other States also get the truck body building work done in Namakkal. Body building for trucks and Rig units are being exported to foreign countries from Namakkal. About 25000 persons got employment directly and indirectly in truck body building activity in Namakkal district. About 300 units in Namakkal and 100 units in Tiruchengode are engaged in this activity.

Namakkal district is also well known for poultry and dairy industries, accounting for a bulk of supply of poultry products to neighboring industries. In fact, Namakkal produces about 65% of the egg output of Tamil Nadu.

4.9.1. Demographic Profile

Demographic features of the Project districts such as total population, population density, sex ratio and literacy rate is presented in **Table 4.26**.

Particulars		Salem	Namakkal
Population	Persons	3480008	1721179
	Males	1780569	866740
	Females	1699439	854439
Sex Ratio (Female / 1000 Male	es)	954	986
Population density (per sq.Kn	n.)	663	506
Literacy	Persons	2285562	1176131
	Males	1285107	653312
	Females	1000455	522819
Working Population	Persons	1694160	898245
	Males	1083797	531463
	Females	610363	366782
Child Dopulation in the age	Persons	344960	150699
Child Population in the age group 0-6	Males	180002	78754
group v-v	Females	164958	71945

Table 4.26.	Demographic Profile of the Project Districts
-------------	--

Source: Census Survey of India, 2011

4.9.2. Settlements/Villages

Major settlements along the project corridors are Namagiripettai, Rasipuram, Tiruchengode, Mohanur and Namakkal. In these, Namagiripettai, Rasipuram, Tiruchengode and Namakkal are being bypassed under Rural Development Scheme, GoTN funded by NABARD. Hence, these towns were excluded from the scope of work. The important settlements along the project corridors are given in **Table 4.27**.

Table 4.27.	Important Settlements along the Project Corridors

4.9.3. Socio-Cultural Resources

4.9.3.1. Religious Center

There are noticeable numbers of religious structures found along the project roads. Corridor wise details of the same are depicted in **Table 4.3**.

4.9.3.2. Cultural Heritage Sites

There are no cultural heritage sites along any of the project roads. Ardhanareeswara temple at Tiruchengode and Anjaneya Temple at Namakkal are the two cultural heritage sites coming within the 10 Km radius of the project corridors.

4.9.3.3. Archeological Monument

Hill fort at Namakkal, a listed monument of Archaeological Survey of India is coming within 10 Km radius of Corridor 5. Other than this, there is no archaeological monument along any of the TNRSP-II PPC03 Roads.

4.9.3.4. Presence of Sensitive Receptors

In addition to the built-up areas, there are a large number of educational institutions, libraries and hospitals are present along the project road. All these features are socially very sensitive and needs critical care in preserving them during widening. Location of these sensitive structures are listed in **Table 4.4**.

Chapter 5. Stakeholder Consultation

5.1. Introduction

Consultative procedure since the inception of the project has been continued during pre-feasibility, feasibility, Environmental Assessment and Management Plan preparation stage considering the fact that involving local communities in the project planning is basis of the participatory planning. Because, often suggestion and option given by the people improves technical and economic efficiency of the project and suggested improvements proposal of the people generates sense of ownership within communities thus eases implementation process.

5.1.1. Definition of Stakeholders

Stakeholders are those who have a direct interest in the project development and whose participation needs to be ensured in consultation at various stages. Stakeholders include project affected people, project beneficiaries, elected representative of legislative assembly, parliament and local self-government bodies and officials of various government departments.

To ensure that stakeholder concerns are incorporated in the project design and to promote public understanding about the project and its implications. Public consultation and information dissemination is treated as a two way process where the information is passed on to public and their feedback is sought to understand their issues. The consultative process is continued throughout the project period – design preparation, implementation and post implementation periods. The preparatory stage consultation helps to explore alternative design options, to avoid very adverse social and environmental impacts and to reduce the magnitude of the impacts of the project by suggesting suitable measures, to identify the environmental hotspots for further enhancement, while consultation during implementation stage helps to facilitate a smooth resettlement of the PAFs thereby enabling speedy implementation of the project.

5.1.2. Stages of Consultation and Information Dissemination

The consultation process formulated for the project employed a range of formal and informal consultative methods including in-depth interviews with key informants, focus group discussions, meetings and workshops. The consultation programmes were scheduled at two stages of the project, which can be broadly classified as:

- Consultation before Project Design
- Consultation after Project Design

5.2. Consultation before Project Design

5.2.1. Identification of Stakeholder

For consultation and participation, primary and secondary stakeholders have been identified considering their expected roles in the planning and implementation of the project. Primary stakeholders are main stakeholders with whom the project has direct interaction.

Primary stakeholders will include Project Affected Persons (PAPs) and Households and Beneficiaries of the project, including representative of vulnerable households. Secondary stakeholders (other stakeholders) will include elected representatives, community leaders of PAPs, representative of CBOs, representative of local NGOs, and official of forest department, public works departments and various other government institutions.

5.2.2. Planning for Consultation

The consultation mechanism has been planned at each level of project preparation. While village level and block level consultation was planned during environmental assessment continue till operation stage, district level consultation, key informant interview and other focused consultative procedure was planned during detailed environmental impact assessment stage. One of the features of present consultation program is to have continued involvement of local engineers of HD and TNRSP in planning and preparation of environmental management framework for the implementation of project largely based on input from concerned stakeholders. The consultation strategies and phases have been discussed and presented in **Table 5.1**.

Stakeholders	Level of Consultation	Start Stages	Future course
PAPs, community, Women groups, NGOs	Village	Before Project design	Started Contd.
HD Officials, TNRSP officials at Field,	PIU and Field Offices	Before Project design	First round completed, Contd.
Forest Official	Divisional and Range level	Before Project design	Ongoing
District Officials of line Department, such as Forest, SLAO	District	Before Project design	Continued
Pollution Control Board	State	Before Project design	Continued
District and State Forest Officials	State	Before Project design	Continued

 Table 5.1.
 Planning and Present Status of Consultation

5.2.3. Focus Group Discussion (FGD)

The overall goal of FGD programme at before project design is to disseminate project information and incorporate PAPs views in the road design and resettlement plan and also to document the existing environmental profile of the project influence area (PIA). The Focus Group Discussion (FGD) adopted for this project involved one time discussion of various topics related to the project such as environmental issues, loss of access and safety, and social issues. The one-time face-to-face meetings were structured to be informal to encourage open discussion among participants in a relaxed atmosphere and were a good way to gauge the opinions of the public. Individual opinion sheets were distributed to all participants at the time of discussion to convey their opinions and suggestions regarding this project and document existing baseline environmental profile.

5.2.4. Details of Focus Group Discussion (FGD) Conducted

In order to document the issues raised by PAPs, public interactions were conducted at nodal points of towns and villages during November and December of 2013. A large number of potentially affected

persons expressed their views about the proposed project. Details of location wise FGDs and issues for the Phase-I roads under TNRSP-IIare presented in **Table 5.2**. Photographs of Focus Group Discussion are presented in **Annexure 5.1**.

Sl	Name of the Location	Subjects and Issues Discussed	Suggestion from the

110		Existing Environmental Profile Existing Traffic Profile	limited to existing land available.
8	Tiruchengode	Objective of the project	Bypass should be provided
		Feasibility of Bypass Option Existing Environmental Profile Existing Traffic Profile	to avoid the present traffic congestion and R& R issues.
Mol	hanur to Namakkal Sect	ion of Road No.5 (SH 95)	
1	Mohanur	Objective of the project Existing Environmental Profile Existing Traffic Profile	Proposed improvement should be limited and to be minimum impact to their land and their property Asked for the connectivity to the new Vangal – Mohanur bridge
2	Namakkal	Objective of the project Existing Environmental Profile Existing Traffic Profile Feasibility of bypass option	Bypass should be provided to avoid the present traffic congestion and R& R issues. Existing road improvement should be taken as part of the project

While analysing the opinion sheets collected from FGD, it became quite clear that the people who are staying and doing the business at major built-up locations are strongly demanding for bypass as developing the highway through the city which will disturb the residential, commercial and religious buildings. The PAFs demanded for market value for their loosing assets and also asked to explore more options to minimise the negative impact. However public raised very few quires/suggestions on environmental components such as felling of tree should be minimum, Speed breaker should be provided at the forest location to avoid the accidents to monkeys etc.

5.2.5. Institutional Level Consultation

Institutional level consultation was conducted to collect their opinion about the project and to collect the secondary details of the study area. Details of various government officials and local body members consulted are presented in **Table 5.3**.

Sl No	Name of the Person	Month of Consultation	Suggestion / Issues / Comments
1	Ms. Padmavathi, IFS, Divisional Forests Officer, Namakkal Mob: +91 9445468243	November 2013 & January 2014	 She informed that a large number of mature trees are present along the project corridors, therefore cutting of trees should be minimized during project. She also informed that some Reserve Forests are located near to the project corridors. To avoid the impacts on forests, she has

Table 5.3.Details of Institutional Level Consultation

Sl No	Name of the Person	Month of Consultation	Suggestion / Issues / Comments
			 suggested to improve the project road towards the non-forests land at these locations. It was informed, that other than reserve forests, there is no any ecologically sensitive areas within 10 Km buffer of the project roads. During this meeting, Consultants requested to stop planting new trees along the project corridors, until finalization of proposed improvement.
2	Mr. Dileep IFS, Assistant Conservator of Forests, Rasipuram Mob: +91 7598422999	November 2013 & January 2014	 After making joint site inspection, Mr. Dileep clarified that two of our project roads are abutting three reserve forests and requires forest clearance if the improvement will take place in the forest area. During the meeting, profile of existing flora and fauna along the project area were discussed. It was informed that, no major wildlife present in the forests along in the project area. It was also confirmed, that there is no migratory route of wild animals in the project area.
3	Mr. Kannaiyan, Forester, Pudupatti Mob: +91 9994710492	November 2013	 Mr. Kannaiyan clarified the exact location where the forest abuts the project roads. He confirmed that no migratory route of wild animals in the area, however Macaques and peacocks are observed in the forest area.
4	Mr. Perumal, Forest Guard, Mayilnadu Mob: +91 9965052650	November 2013	• Mr. Perumal confirmed that no migratory route of wild animals in the area, however Macaques and peacocks are observed in the forest area.
5	Mr. Virappan, Drafting Officer, Namakkal Forest Office	January 2014	 Mr. Virappan clarified the exact location where the forest abuts the project roads. He also showed the starting and ending locations of the forest areas
6	Mr. Karkathiran, Range Forest officer, Namakkal	January, 2014	• Mr. Karkathiran showed the forest area abutting project road and confirmed that no migratory route of wild animals in the area.
7	Mr. Sridhar Executive Engineer Oil and Ash Handling Division, Mettur Thermal Power Station, Mettur. Mob: +91 9445856773	March 2014	 Mr. Sridhar was consulted to obtain the details on quantity and rate of fly ash available with MTPS. He provided the said details vide Letter No. CE/SE/M.II/EE/O&AHS/MTPS-I/F.Wet ash / D.300/2014, dated 22.04.14
8	Ms. G. Sivagami Junior Engineer	March 2014	• Ms. Sivagami was consulted to obtain the surface water quality of Thirumanimitharu

No	Hydrology Division CWC, Chennai.	Consultation	 River at Elachipalayam and Paramathi and Cauvery River at Mettur, Bhavani, Erode, Musiri, Mukkombu, and Trichy. It was informed that, the said data is not
9	Mr. Palanichamy Panchayath President Kandapalayam Panchayath Mob:9585344433	March 2014	 available. Mr. Palanichami was consulted about the various issues especially about the project road is passing through his panchayat. He expressed his concern on land acquisition and building demolition through his panchayath and requested to avoid building present next to road in the village areas.
10	Mr. Palanivel, Panchayat President, Eswaramurthypalayam Panchayat Mob: +91 9451395777	November 2013	 Mr. Palanivel was consulted about the various issues especially about the project road is passing through his panchayat. He also shared the concerns of persons those who are staying close to roads. He also asked to get the unskilled works to locals during construction period
11	Mr. Ramaswami, Panchayat President, Ponkurichi Panchayat Mob: +91 9443029678	January 2014	 Mr. Ramaswami was consulted about the various issues especially about the project road is passing through his panchayat. He also shared the concerns of persons those who are staying close to roads.
12	Mr. Jyothilingam Panchayath President Mangalapuram Panchayath Mob: 9626781792	March 2014	 Mr. Jyothilingam was consulted about the various issues especially about the project road is passing through his panchayat. He also shared the concerns of persons those who are staying close to roads.
13	Mr. E.K Kaliyannan Panchayath President Vaiyappamalai Panchayath Mob: 9626781792	March 2014	 Mr. Kaliyannan was consulted about the various issues especially about the project road is passing through his panchayat. He expressed his concern on land acquisition and building demolition through his panchayath and requested to avoid building present next to road in the village areas. He also asked about proposed project improvement at curve section near Vaiyappamalai hill.
14	Mr. Manivanam, Depot Manager, Agricultural Department, Maliyakarai Mob: +91 9543955134	December 2014	• Mr. Manivanam was consulted to get the agricultural profile of the project area
15	Mr. Ramalingam, Revenue Officer, Rasipuram Taluk	December 2014	• Mr. Ramalingam was consulted to get the FMB sketches of project roads near the forest area.

5.3. Consultation after Project Design

After the design of the proposed improvements, consultation at individual level, in groups and structured public consultation meetings at selected locations were conducted. The consultation mechanism devised to ensure that people are consulted; their project related decision/opinions are gathered and agreement reached on their suggestion/preferences is shared with the community. For this purpose, the consultation mechanism was initiated with the information dissemination, followed by structured public consultation meetings.

5.3.1. Information Dissemination

- While conducting inventory of environmental features along the project roads, the consultant has conducted information dissemination along the project route by one to one canvassing about proposed improvement.
- Potential project affected families were consulted to inform them about proposed road improvement program and possible environmental conflict such as tree cutting, relocation of utilities.

5.3.2. Structured Public Consultation Meetings

Public Consultation refers to the process by which the concerns of local affected persons and others who have plausible stake in the environmental impacts of the project or activity are ascertained with a view to taking into account all the material concerns in the project or activity design as appropriate. Local affected persons are the stakeholders (such as land owners, tenants) who are directly affected by the proposed project activities. Other concerned persons are local NGOs, officials of various government departments and local residents who are indirectly affected by project activities. The key informants during the public consultation included both individuals and groups namely:

- Heads and members of households likely to be affected
- Groups/clusters of PAPs
- Village Panchayats heads and members
- Local voluntary organizations, CBOs and NGOs
- Government agencies and departments such as local revenue authority, PHED, PWD, Forest, Horticulture, agriculture etc.
- Other project stakeholders with special focus on PAPs belonging to the vulnerable group.

For TNRSP-II PPC03 roads, section wise public consultation was conducted. Locations were selected at middle portion of the project stretch based on considering the better accessibility; well know place to public and prime village/town in the project region.

Structured Public consultation was conducted at Kandampalayam village for Tiruchengode to Paramathy Section of Road No. 2, at Mangalapuram for Malliyakarai to Rasipuram 4 section of Road No. 4 (Section I), at Vaiyappamalai for Rasipuram to Tiruchengode section of Road No. 4 (Section II) and at Mohanur for Mohanur to Namakkal Section of Road No. 5, to assess the perception of the people towards the project. Public Consultation photos and filled registration forms are presented in

Annexure 5.2 & Annexure 5.3 respectively. Summary of the Public Consultation is given in the following table.

Tiruchengode to Paramathy Section of Road No. 2 (SH 86)				
Location: Kandampalayam				
me: 29.04.2014, 11 am Subj	ects and issued discussed			
ani Thirumana Mandapam Participants: Officials from Department and TNRSP, presentatives, Businessmen, land cum building owners etc. of participants: 56 F A C F C F C F C F C F C F C C C C C C C C C C C C C	ects and issued discussedRequested bypass for Kandampalayam and ManiyanurDiscussed the accident rate and vehicle traffic after he improvementProper safety measures like road markings, speed preakers, zebra crossings and signboards should be provided at all sensitive receptor's locationAdditional road facilities like foot path, storm water drainage <i>etc.</i> should be provided as part of this project.Requested the proposed improvement should be estricted within the highway land available and land acquisition should be minimumDemanded for adequate R&R Packages and Market value for the losing assets and livelihoods.No. of trees to be felled for the project should be ninimum and additional land has to be acquired for compensatory tree plantation.			
• H M f • H S • C E • H M M	Requested a link road from near Siva Temple, Mavureddy to NH 7, and it can be act as a bypass for Paramathi town. Requested to provide the median from Seyyampalayam junction to Perunkurichi junction. Curves at Otharasu bus stop and Sithalandhur should be straighten as part of the project Bus stand (with toilet facility) should be provided at Maniyanur and Kandampalayam Mariamman Temple, Nallur should be protected

Proper safety measures like road markings, speed preakers, zebra crossings and signboards should be provided at all sensitive receptor's location Requested to avoid the tree felling Demanded for adequate R&R Packages and Market			
of participants: 79 I	Requested to avoid the tree felling			

Table 5.4.Minutes of Public Consultation Meetings

Contract PPC03	-
	 Demanded to remove the all encroachments on the highway land and accommodate the utilities there. Requested a detailed meeting is required at next
	stages of project.
Location: Vaiyappamalai (Section II)	
Date & Time : 30.04.2014, 3.00 pm	Subjects and issues discussed
Venue: Lakshmi Thirumanna Mandapaam Type of Participants: Officials from	• Requested bypass for Vaiyappamalai and Elachipalayam towns to reduce the impact on existing features at these towns
Highway Department and TNRSP, Local representatives, Businessmen,	• Improvement should be done using the existing available highway land
peasants, land cum building owners etc. Total no. of participants: 134	• Additional road facilities like foot path, storm water drainage etc. should be provided as part of this project
	• Proper safety measures like road markings, speed breakers, zebra crossings and signboards should be provided at all sensitive receptor's location
	• Requested the proposed improvement should be restricted within the highway land available and land acquisition should be minimum
	• Schools along the project road have to be protected from the proposed improvement
	• Demanded for adequate R&R Packages and Market value for the losing assets and livelihoods.
	• All the water facilities like bore wells, water channels, Cauvery river water carrying pipes, overhead tanks should not be damaged due to project.
	• Detailed meeting is required at next stages of project.
Mohanur to Namakkal Section of Road	No.5 (SH 95)
Location: Mohanur	
Date & Time : 01.05.2014, 11 am	Subjects and issued discussed
Venue: Navaldiyan Thirumana	Requested bypass for Mohanur town
Mandapam Type of Participants: Officials from	• Improvement should be done using the existing available highway land and minimum acquisition
Highway Department and TNRSP, Local representatives, Businessmen, peasants, land cum building owners etc.	• Demanded to remove the all encroachments on the highway land and thus minimize the acquisition.
Total no. of participants: 51	• No. of trees to be felled for the project should be minimum and the same species has to be planted as compensatory plantation
	• Cauvery water supply pipelines should be protected from proposed improvement
	• Water bodies along the project road are to be protected from proposed improvement.
	 Requested bus bays for all bus stops All the public utilities should be saved from
	• All the public utilities should be saved from proposed improvement

While analyzing the opinion sheets collected from public consultation, it became quite clear that the people who are staying and doing the business at town locations are strongly demanding for bypass. The PAFs demanded market value for their losing assets and also asked to explore more options to minimize the negative impact. The consultant has assured that all the issue/ suggestions raised by public will be considered during designing of the project alignment contemplating with technical, social, environmental and economic feasibility.

5.3.3. Role and Responsibilities Identified during Consultation

Based on the consultation during feasibility stage of environmental assessment a framework for LA, R&R and Environmental impact mitigation have been envisaged in **Table 5.5** along with responsibilities of officials and expected benefits from the project.

Stakeholders	Roles and Responsibility	Expected Benefit for the Project
Potential Project Affected Persons, Project affected groups, Project Affected Communities, Host population	 Participate in formal and informal public meeting, Raise critical issues relevant to the environment, Suggest alternative alignments, environmental impact management, Options of widening to save trees and other environmental features, Methodologies for agreement on compensation and assistance, Suggest methodologies for continued participation in project cycle 	 Easing implementation. Incorporation of good practices (From long term memories of the people) of the past in project design. Planning for road safety issues. Community Capacity building and sense of ownership of the project,
Engineers –TNRSP and HD	 Land Acquisition Avenue tree transplantation Ensure continued consultation Participate in Block and District Level Meeting 	 Easing implementation Reduce the impact of micro climate People oriented planning Ensured public cooperation Determination of value
District Collector and Forest Officials	 Enumeration of trees Identification of eco sensitive hot spots Permission for tree cutting 	 Easing implementation Helps in designing of alignment at forest areas, Incorporating adequate road safety measures at forest areas
NGOs/CBOs	 Ensure public participation in project preparation and implementation, Assist TNRSP and Government for dovetailing Government schemes for income generation schemes, 	 Public are informed Opinion and preferences of people are known Easy to develop community capacity development plan.

 Table 5.5.
 Role and Responsibilities Identified after Consultation for TNRSP

5.4. Lessons Learnt from Consultation and Suggested Framework for Environmental Management Plan

5.4.1. Issues of Tree Cutting

Green Tunnel areas are observed about 8.15 Km and 3 Km in Cor 4 – Malliyakarai to Tiruchengode Section of SH 79 and Cor 5 – Mohanur to Namakkal Section of SH 95 respectively. While discussing strategies to save trees in these kinds of stretches people suggested that these trees are mature and adequate safety measures should be taken up during design to save these trees. Therefore it was decided that tree felling would be restricted with maximum compromise in alignment design (within MoRTH limits) and to adopt eccentric widening at green tunnel locations based on considering the geometry, topography and land use condition of the road stretch. Due to this, at least on side of the well grown avenue plantation can be saved, during road improvement. Adequate plantation measures, not limiting to compensatory avenue plantation, will be carried out in government office premises and cultural properties along the project roads.

5.4.2. Monitoring Plan and Training

Information collected during environment surveys (air quality, water quality and other parameters), baseline environmental monitoring and consultation suggests periodic monitoring plan should be gauged by considering specific but limited number of environmental parameters. Therefore, Monitoring strategies for the project should devise a specific plan. Training and capacity building component of environmental team should be part of consolidated training program of TNRSP and budgeted in training and institutional components of the project.

5.4.3. Community Properties Resources (CPRs) Enhancement

Regarding community properties enhancement, village community is willing to come forward to cooperate with HD in the enhancement of religious properties. This is learnt from consultation that generally CPRs do not receive due attention during construction as a result actual enhancement do not take place. Therefore, project authority should plan for alternative implementation arrangement or strengthen its periodic monitoring of physical and financial progress of such enhancement.

Chapter 6. Analysis of Alternatives

6.1. Background

This chapter presents a comparative analysis of various alternatives considered to avoid or minimize impacts that would be inevitable if technically (based on design speed and geometrics), best-fit, alignment is followed. Cross sections adopted for the upgradation component are flexible in design to avoid most of the impacts within RoW. An analysis of various alternatives is attempted to arrive at the technically and environmentally best-fit alignment.

6.2. Integration of Environmental Consideration in the Alternatives

The social and environmental considerations were an integral part of the design and environmental assessment process. There are large number of settlements as seen in the baseline environmental scenario along the corridor, where there is constricted RoW and traffic is higher leading to congestion, delay as well as various environmental impacts. Several alternatives are analysed for avoiding localized environmental impacts and arriving at the best-fit alignment.

The retaining walls will be provided in all required locations as given in the Environmental Management Plans. The cut soil material are included in the estimation of soil together with material from borrow areas. The analysis of alternatives has been prepared in accordance with the requirements of the World Bank and GoI guidelines.

6.3. "With" And "Without" Scenarios

In the case of the project roads under consideration, consideration of the 'No Action' and 'Action Alternatives' have been examined as provided in the following subsections;

6.3.1. No Action Alternative

The 'no action alternative' will prevail and this will continue even when a shorter, attractive, road exists. The economic development of the region will not take place. These roads will have an impact to the local area development especially in the education sector and industries. Rasipuram, Namakkal and Tiruchengode are the major cities along the project corridors. The local people along the project road, even from interior depend on these cities for educations and business activities.

Accidents and road safety will remain as an issue to be resolved. The other aspects that will not be improved include no improvements beyond limited routine maintenance and rehabilitation of roads without any acquisition of land or buildings, removal of trees or other disturbance to the environment. There would be no improvements to drainage systems beyond their restoration to existing levels of service, no removal of impediments to pedestrians or construction of facilities for pedestrians and other slow moving traffic. This would leave the highway in its current appalling state.

The 'no action' option will not allow a change in the level of service along this alignment. The nature of the road is not sufficient to meet the development of the region. The traffic flow is impaired by conflicts between local, and through traffic, mixed with pedestrian movements and inadequate and/or inappropriate roadside facilities along the narrow corridors. The unsafe conditions and the environmental consequences (air and noise pollution and degraded environmental conditions) will continue and worsen. The no improvement condition and in the long term be a serious impediment to the development of the economy and thus to the improvement of conditions for all sections of the population.

6.3.2. Action Alternative

Population and traffic growth will continue to occur and exacerbate in an already critical situation. The "with" scenario, has been determined to be economically viable and would meet the local communities aspirations to a large degree. It would, thereby, contribute to the development goals of the project regions and thus to the entire Tamil Nadu State, improve road safety conditions, enhance economic efficiency and growth potential of the area, and improve the well-being and livelihood of those within the potentially affected area of the project road.

Potential negative environmental impacts associated with the "with" scenario can be reduced through good engineering practice and, where warranted, appropriate mitigation and enhancement actions as specified herein.

6.4. Bypass Alignment Study

During pre-feasibility stage, necessity of bypass for three built-up locations i.e. Rasipuram, During pre-feasibility stage, necessity of bypass for three built-up locations i.e. Rasipuram, Tiruchengode and Namakkal were envisaged. However, Highway Department, Government of Tail Nadu (GoTN) has proposed bypasses for Rasipuram and Tiruchengode towns under a separate scheme funded by NABARD. For Namakkal town, Outer Ring Road (ORR) was proposed by Highway Department, GoTN under a separate scheme funded by NABARD. Hence, no bypass study was conducted by consultants for these towns.

6.5. Realignment Study

All geometric design elements have been carried out as per design standards stipulated for project in consonance with IRC codal provisions. Comprehensive design standards, which link individual design elements to best estimates of actual speed have been utilized. The objective is that drivers must not be presented with the unexpected. The emphasis has been given on maintaining continuity or giving adequate warning where it could not be made. There are some locations on the project roads which are critical from geometric deficiencies. Realignments are considered for geometric improvements at these locations.

6.5.1. Realignment Proposed for Tiruchengode to Paramathy Section of Road No. 2 (SH 86)

One realignment is proposed for Road No 2 where the geometric improvement is required. The existing alignment from Km 55+600 to Km 55+750 has a curve having existing speed of about 35 to 40 Kmph with short tangents giving the appearance of kind. Also, subsequent section has sharp curve

which has existing speed of about 30 Kmph. So in order to avoid discomfort to road users, the location is geometrically improved by proposing short realignment for a length of 150 m. Existing landuse of proposed realignment is Agriculture / Open land. There are 28 trees are to be cut for the proposed realignment. Out of these 22 trees are government and 6 trees are private. One shrine is likely to be affected due to proposed realignment. Layout plan of the realignment location is presented in **Annexure 6.1**.

6.5.2. Realignment Proposed for Malliyakarai to Rasipuram (Section I) and Rasipuram to Tiruchengode (Section II) Sections of Road No.4. (SH 79)

The necessity of realignment is felt at seven locations in the Road No. 4 (SH79), which are presented in **Table 6.1**.

Sl.	Existing Chainage (Km)		Length of Existing	Reason for Realignment
No.	From	То	Road Realigned (m)	
Section I - Malliyakarai – Rasipuram Section of SH 79				
1	0+320	0+500	180	Geometric Deficiency
2	2+900	3+130	230	Geometric Deficiency
3	8+260	8+650	390	Geometric Deficiency
4	20+600	20+800	200	Sharp Curve
5	29+600	29+930	330	Geometric Deficiency
Section II - Rasipuram – Tiruchengode Section of SH 79				
1	59+900	60+300	400	Geometric Deficiency
2	61+450	62+000	550	Sharp Curve

Table 6.1.Details of Realignments Proposed for Road No.4

6.5.2.1. Realignment from Km 0+320 to Km 0+500

The existing alignment between Km 0+320 to Km 0+500 passes through series of curves having radii varying from 100m to 170m and the speed at these locations is 35 to 50 Kmph. Considering the sharp curves, short tangents and has speed as low as 35 Kmph, the preceding and subsequent sections have 80 Kmph. This sudden variation in speed and poor geometry at this location is leading to discomfort for road users and in turn resulting in accidents.

Considering above constrains, a realignment is proposed at this location for a length of 180m. This avoids the 3 minor curves and can attain 80 Kmph speed. The general landuse of the region is minor settlement and open land. However no buildings will be affected due to proposed realignment. 22 trees are affected due to proposed realignment, all are government trees. One canal will cross the proposed realignment. Other than this, realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas. Drawing of the realignment location is presented as **Annexure 6.2.**

6.5.2.2. Realignment from Km 2+900 to Km 3+130

The existing alignment from Km 2+900 to Km 3+130 is having reverse curves with short tangents which gives appearance of kinks. To avoid distortions in appearance and discomfort for road commuters, the location is proposed for realignment. Total length of proposed realignment is 230m. This avoids the 2 minor curves and can attain 80 Kmph speed. The general landuse of the region is

open land, minor settlement and agriculture. There are 33 trees are affected due to proposed realignment. Out of these, 32 trees are government trees and one tree is private. Realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas. Drawing of the realignment location is presented as **Annexure 6.2**.

6.5.2.3. Realignment from Km 8+260 to Km 8+650

The existing alignment between Km 8+260 and Km 8+650 is having reverse curves with short tangents which gives appearance of kinks. To avoid distortions in appearance and discomfort for road users, the location is proposed for realignment. Total length of proposed realignment is 390m. This avoids the 2 minor curves and can attain 80 Kmph speed. The general landuse of the region is agricultural and open land. There are 51 trees are affected due to proposed realignment. Out of these 48 trees are government trees and 3 trees are private trees. Realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas. Drawing of the realignment location is presented as **Annexure 6.2**.

6.5.2.4. Realignment from Km 20+600 to Km 20+800

The existing alignment between Km 20+600 and Km 20+800 passes through sharp curves with short tangents having radii varying from 70 to 90m and the speed at these locations is 35 to 40Kmph, the preceding and subsequent sections have 65 to 80 Kmph. This sudden variation in speed and poor geometry at this location is leading to discomfort for road users and in turn resulting in accidents.

Total length of proposed realignment is 200m. This avoids the one minor curves and can attain 65 Kmph speed. The general landuse of the region is minor builtup area. 14 trees are affected due to proposed realignment. Out of these 6 trees are government and 8 trees are government. As per preliminary study 5 residential houses may get affected due to proposed alignment. One minor water tank (syntex tank) is falling within the proposed realignment location. Realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas. Drawing of the realignment location is presented as **Annexure 6.2**.

6.5.2.5. Realignment from Km 29+600 to Km 29+930

The existing alignment between Km 29+600 and Km 29+930 is having compound curves with short tangents. To ensure safe and smooth transition from one curve, the location is proposed for realignment. Total length of proposed realignment is 330m. This avoids the two minor curves and can attain 65 Kmph speed. The general landuse of the region is agriculture. 12 trees are affected due to proposed realignment. As per preliminary study one residential house may get affected due to proposed realignment. Realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas. Drawing of the realignment location is presented as **Annexure 6.2.**

6.5.2.6. Realignment from Km 59+900 to Km 60+300

The existing alignment between Km 59+900 to Km 60+300 passes through series of curves with short tangents, considering the poor geometry at this location is proposed for realignment. Total length of proposed realignment is 400m. This avoids the three minor curves and can attain 80 Kmph speed. The general landuse of the region is minor settlement and agricultural land. There are 24 trees affected due to proposed realignment. Out of these 22 trees are government trees and 2 trees are private trees. As

per preliminary study five residential houses may get affected due to proposed realignment. Two minor water tanks (syntax tank) and one bore well are falling within the proposed realignment location. Realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas. Drawing of the realignment location is presented as **Annexure 6.2**.

6.5.2.7. Realignment from Km 61+450 to Km 62+000

The existing alignment between Km 61+450 and Km 62+000 passes through series of curves having radii varying from 50m to 110m and the speed at these locations is 35 to 50Kmph proposed for realignment. Total length of proposed realignment is 550m.

Existing major bridge for Thirumanimuthar river is located at chainage 61+955 consists of 15 spans of 4.4m each, with a total length of 66m. This Bridge has carriageway width inadequate to accommodate standard two lane traffic. The RCC deck slab is in fair condition. The superstructure has been united recently. RCC pillars with Steel rods are provided for handrail but same is in poor condition. Condition of the substructure is fair and vegetation growth is observed on superstructure. The bridge is hydraulically adequate and the drainage spouts are given but not functioning.

Major Bridge at Km 61+955

The section has sharp curves, short tangents and has speed as low as 35 Kmph, the preceding and subsequent sections have speed varying from 65 to 80 Kmph. This sudden variation in speed and poor geometry at this location is leading to discomfort for road users and in turn resulting in accidents.

The general landuse of the region is open land area. There are 90 trees are affected due to the proposed realignment Out of these, 82 trees are Government trees and 8 trees are private trees. As per preliminary study five residential houses are may get affected due to proposed realignment. Both existing and proposed alignment are crossing Thirumanimuthar River at this location. Thirumanimuthar River is a seasonal river, having water during rainy season. As per preliminary study three residential houses may get affected due to proposed realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas.

Considering above constraints, a realignment has been proposed at this location with a major bridge. Major Bridge of total length 67.5m with a span arrangement of 5 x 13.5m is proposed in the realignment. Total width of 12.9m, comprising of 10.5m wide carriageway and 0.75m wide raised safety kerb & 0.45m wide crash barrier on either side is proposed. RCC T - beam superstructure and

RCC substructure with open foundation is proposed. Drawing of the realignment location is presented as **Annexure 6.2**.

6.5.3. Realignment Proposed for Mohanur to Namakkal Section of Road No.5 (SH 95)

The necessity of realignment is felt two locations in Road No. 5 (SH95). Details of realignment proposed are presented in **Table 6.2**.

Sl.	Existing Chaina	age (Km)	Length of Existing	Reason for Realignment	
No.	From	То	Road Realigned (m)		
1	2+020	2+475	450	Geometric Improvement	
2	6+595 6+960		350	Geometric Improvement	

Table 6.2.	Details of Realignments Proposed for Road No.5
------------	--

6.5.3.1. Realignment from Km 2+020 to Km 2+475

The existing alignment between Km2+020 to Km 2+475 passes through series of curves with short tangents, considering the poor geometry at this location is proposed for realignment. Total length of proposed realignment is 450m.

Existing minor bridge is located at Km 2+280 consist of 9 spans of varying length with a total length of 22.4m. The depth from the road level to bed level is 1.5m. Footpaths are not provided. Clear carriageway width is 7.25m and the total width is 8m. RCC slab superstructure and solid SSM wall type substructures with open foundations are provided. HFL at the bridge location is 0.2m from the bottom of the soffit of slab. Skew angle of 44.7 degree. Bituminous wearing coat and hand railing are provided. One side approach of the Bridge comes on a curve. There is a Railway track on LHS side, which is almost parallel to the existing minor bridge.

This Bridge has carriageway width inadequate to accommodate standard two lane traffic. The RCC deck slab is in fair condition. The superstructure has been united recently. RCC pillars with Steel rods are provided for handrail but same is in fair condition. Condition of the substructure is fair. The bridge is hydraulically inadequate.

Minor Bridge at Km 2+280

The general landuse of the region is Agricultural land. There are 52 trees are to be felled due to proposed realignment. Out of these 44 trees are Government trees and 8 trees are private trees. There is one pond located on RHS of the existing project alignment. Proposed realignment is passing through a small portion of the pond. Realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas.

Considering above constraints, realignment has been proposed at this location with a minor bridge. Minor Bridge of total length 18.5m with a span arrangement of 3 x 5.5m is proposed in the realignment at design chainage 2+279. Total width of 12.9m, comprising of 10.5m wide carriageway and 0.75m wide raised safety kerb & 0.45m wide crash barrier on either side is proposed. RCC Box bridge is proposed. Drawing of the realignment location is presented as **Annexure 6.3**.

6.5.3.2. Realignment from Km 6+595 to Km 6+960

The existing alignment between Km 6+595 to Km 6+960 passes through series of curves with short tangents, considering the poor geometry at this location is proposed for realignment. Total length of proposed realignment is 350m. This avoids the two minor curves and can attain 80 Kmph speed. The general landuse of the region is agricultural / open land. 59 trees are to get affected due to proposed realignment. Out of this, 46 trees are government trees and 13 trees are private trees. Realignment location is free from sensitive receptors, religious structures, cultural properties and forest areas. Drawing of the realignment location is presented as **Annexure 6.3**.

Chapter 7. Project Impacts and Issues

7.1. Project Impact and Issues

This chapter discusses the impacts due to the project activities upon different components of the local and / or regional environment. With increasing socio-economic activities, the demand for an efficient transportation network also increases. It is required to establish an efficient, optimized and durable road infrastructure for the overall social and economic development throughout the country. It is quite evident from the past experience that road revamping / construction projects give rise to diverse impacts that are beneficial as well as adverse on environmental and social profile of the project influence area. The adverse impacts associated with the project may be long term or temporary and its intensity may also vary both spatially and temporally depending on the nature of project intervention during the various stages of the project and the baseline environmental quality of the project area. Major factors influencing the environmental factors are:

- Settlement Pattern
- Topography / terrain plain, rolling or hilly
- Land use pattern agricultural, built-up (residential, commercial, industrial) etc.
- Other physical features

As mentioned in the earlier chapters the improvement proposal includes 2 lane road with paved shoulder configuration along with road furniture and other accessories. The direct impact zone is in the range of 16-23 m of corridors depending upon the land use pattern. Magnitude of indirect impact varies depending upon the location of environmental receptors and type of impact. The planning of project intervention and its impacts on the environmental, social and cultural components were studied for pre-construction, construction and operation stages.

Tables 7.1A& **7.1B** given below presents the general environmental impacts expected due to the proposed upgradation of the project road. Impacts have been assessed based on the information collected from the screening & scoping of environmental attributes at feasibility stage. The subsequent sections deal with the prediction of impacts due to the project on the natural environment and socio & cultural environment.

Besides the impact on natural environment, there will be socio-economic impacts due to disruptions on the social and economic interactions of communities. This involves effect on both the adjacent communities (mostly direct) as well as the nearby communities (mostly indirect). The various impacts have been detailed as:

- General impacts that apply to the entire project corridor,
- Specific impacts on likely properties and PAPs, within the Corridor of Impact (CoI) of the project corridors.

Matrix method was followed for the identification and evaluation of impacts. The activity - impact identification matrix is presented as **Annexure 7.1**.

Table 7.1 A. General Impacts on Natural Environment

Project Activity	Planning and Design Phase	Pre-construc	tion Phase	Construction	n Phase				Operation	Indirect effects of operation or Induced development	
Env. component Affected	Land acquisition	Removal of Structures	Removal of trees and vegetation	Earth works including quarrying	1	Vehicle & Machine operation & maintenance	Asphalt & crusher plants	Sanitation & Waste (labour campus)	Vehicle operation		
Air		Dust gen- eration during dis- mantling	Reduced buffering of air and noise pollution, Hotter, drier microclimate	Dust generation	Asphalt odour	Noise and dust pollution	Noise, soot, odour and dust pollution	Odour / smoke	Noise and dust pollution	other pollution	
Land	Loss of productive Land	Generation of debris	Erosion and loss of top soil	Erosion and loss of top soil		Contamina- tion by fuel and lubricants Compaction	Contamina- tion and Compaction of soil	Contami- nation from wastes	Spill from accidents Deposition of lead	Change in cropping pattern	
Water	Loss of water sources	Siltation due to loose earth	Siltation due to loose earth	Alteration of drainage Break in continuity of ditches Siltation, Stagnant water pools in quarries.	of ground water re-	Contamina- tion by fuel and lubricants	Contamina- tion by as- phalt leakage or fuel	Contami- nation from wastes Overuse	Spill Contamination by fuel, lubricants and washing of vehicles	Increased con- tamination of ground water	
Noise		Noise Pollution	Noise Pollution due to machinery	Noise Pollution from DG sets		Noise pollu- tion	Noise Pollution		Noise Pollution	Noise pollution	
Flora		Loss of		Lowered		Removal of	Lower	Felling trees	Impact of		

Project Activity	Planning and Design Phase	Pre-construc	ction Phase					Operation	Indirect effects of operation or Induced development	
		Biomass		productivity Loss of ground for vegetation		C	productivity Use as fuel wood	for fuel	pollution on vegetation Lowered pro- ductivity	
Fauna			Disturbance Habitat loss	Disturbance		Disturbance	Disturbance	Poaching	Collision with traffic	Distorted habitat

Table 7.1 B. General Impact on Social and Cultural Environment

Project	Planning	Pre-Const	ruction Phase		Construction	on Phase				Operation	
-	and Design Phase								Direct	Indirect Induced development	
Env. Component Affected	Design de- cisions & Implemen- tation poli- cies	Land acquisition		Removal of trees & vegetation	Earth works including quarrying	1	Vehicle & machine operation & maintenance		Labour Camps	Vehicle operation	-
Agricultural land	-	Change in land prices	Loss of land economic value	Loss of standing crops	Loss of productive land	-	-	Dust on agricultural land reduce n productivity	-	-	Conversion of Agricultural Land
Buildings and built structures	-	-	Loss of structures, Debris generation, Noise and Air pollution	-	Noise and vibration may cause damage to structures	-	Noise and vibration may cause damage to structures	Dust accu- mulation on building and structure	-	Vibration and noise	Change in building use and characteristics

Project	Planning	Pre-Constr	uction Phase		Construction	on Phase				Operation	
Activity	and Design Phase									Direct	Indirect Induced
											development
People and Community	Anxiety and fear among community		Displacement of people Psychological impact on people loss of liveli- hood	shade &	Noise and Air pollution	Odour and dust	Noise and Air pollution, Collision with pedestrians livestock and vehicles	Air and noise pollution and discomfort			Induced pollution
Cultural Assets	-		Displacement loss of structure from RoW	Loss of sa- cred trees.	Noise, vi- bration may cause damage to structure	-	Damage from vibra- tion & air pollution	Dust accumulation	-	Damage from vibration & air pollution	-
Utilities and Amenities	-		Interruption in supply	-	-	-	Damage to utility and amenities	Dust accu- mulation on water bodies	Pressure on existing amenities		-
Labour's Health & Safety	-	-	-	-	Increase of stagnant water and disease	Asphalt odour and dust	Collisions with vehi- cles, pedestrians & livestock	Impact on health due to inhalation of dust	Increase in communica- ble diseases		-

7.2. Project Intervention

The project intervention necessitates dismantling of few roadside residential and commercial structures, clearing of vegetation and removal of trees coming in the proposed improvement. In addition project road up-gradation will require huge quantity of borrow earth and aggregates. Details of raw materials required for Phase-I roads under TNRSP-II PPC03 are presented in **Table 7.6**. The quarries for these aggregates are locally available and hence no significant direct impact is envisaged.

7.2.1. Land Acquisition

Up-gradation of project road requires acquisition of agricultural land, commercial/residential land and open land, wherever the existing RoW is not accommodating design scheme. Further, the horizontal and vertical alignment will be improved to the standard as per IRC/MoRTH guidelines, which requires additional land for realignments to avoid the geometric deficiency.

The total land to be acquired for the strengthening of Tiruchengode to Paramathy section of SH 86 is 5.20 ha, Malliyakarai to Tiruchengode section of SH 79 is 9.39 Ha and Mohanur to Namakkal section of SH 95 is 0.35 Ha. **Table 7.2** presents the details of land acquisition for the project roads.

The project roads run through fertile agricultural lands and settlements and hence, the impacts of land acquisition are expected to have significant effect on livelihood and economic activities of the project area.

7.2.2. Removal of Structures

During the proposed improvements of the project roads, roadside dwellings and business units would be impacted. Engineering design team in consultation with environmental and social team has minimized/restricted land width in contiguous built-up areas. Even after such engineering efforts some of this residential and business unit required to be dismantled (partially or fully). **Table 7.4A.** Quantity of Materials to be Removed

7.3. Air Environment – Impacts

Motor vehicles have emerged as one of the major sources of air pollution especially in town area. Due to the proposed road improvements aimed at enhancing the efficiency of road transport system the number of vehicles on these roads will be increased overtime, so impacts on ambient air environment may be significant, which needs detailed analysis.

7.3.1. Meteorological Factors and Climate

Construction Phase

Felling of avenue trees, laying of pavement and other construction activity may cause temporary impact on micro climate of the project influence area. Other than this, no other significant impacts are envisaged in climatic parameters such as precipitation, wind speed, wind direction, temperature, relative humidity etc.

Operation Phase

The objective of the present project is only to improve the existing road. Hence, no changes in climatic conditions are anticipated.

7.3.2. Air Quality – Emissions

Preconstruction Phase

The preconstruction stage activities include site clearance, shifting of utilities, removal of trees present in the corridor of impact (CoI), transportation of man and material, construction of accommodations, construction of stock yards, installation of construction plants, and construction of office buildings. Dust generatig activities would be predominant during pre-construction stage particularly if preconstruction tasks are performed during dry weather.

The impacts due to the preconstruction activity are temporary and location specific and the corridor of impact is limited. Quantification of impacts at the preconstruction stage is very difficult as these are very temporary and localized.

Construction Phase

Vehicular emissions are one of the major sources of air quality impacts of road projects. As the project envisages improvement of road conditions for smooth traffic flow, the project will have beneficial impact on air quality of the region during its operation. However, with respect to compliance of ambient air quality standards during the post improvement phase of the road, due to increase in the traffic volume, the impact on air quality along the project corridors is likely to be minor.

Impacts on air quality during the construction phase of the project will be considerable as the amount of work involved in improvement of the roads is significant. However, any possible impacts will be transitory. Provision of adequate air pollution control equipment, like dust filters and measures like dust suppression by water sprinkling and planting of green belt may further help to significantly reduce the impact.

Emission of CO_2 and NO_X due to combustion of diesel from vehicles, hot mix plant, batch mix plant, diesel generator sets etc. will be a principal cause of air pollution during the construction phase. The data on fuel utilization rates of units likely to be in operation during the road improvement are provided in **Table 7.7**.

Machines	Fuel Consumption (Litres/hour)
Cement concrete mixer	7
Truck	8
Bulldozer	20
Grader	12
Roller	20
Dumpers & Tippers	18
Water Tanker	8
Paver	12

Table 7.7.	Fuel Consumption Rates for Construction Machinery

Source: Indian Institute of Petroleum

Due to ground level temperature inversion at site during winter months, meteorological conditions after the sunset tend to become stable. The overall meteorological parameters thus constitute adverse conditions for dispersion of ground based air pollution emissions. Under adverse meteorological conditions, it may be possible that the NO_X standards (80 μ g/m³ for 24 hourly averages) may be violated only if the construction work is carried out round the clock. However, this scenario is not envisaged, as the construction is not proposed to be carried out round the clock.

Fugitive dust generation due to operations such as excavation of construction materials in borrow and quarry areas, loading, transportation and unloading of construction materials, cutting and drilling of rock masses and dust due to other construction activities. Fugitive dust released during above activities may cause immediate effect on construction workers, and people residing along the alignments especially those in downward wind direction. Most of the generated pollutants due to these construction activities are limited to construction phase and confined to impact zone.

Operation Phase

After improvement of the existing road, the traffic is expected to move smoothly at higher designed speed, which will ensure lower emissions of gaseous pollutants. This will further improve air quality in the region and hence, the project is not expected to affect the air quality adversely. The rate of emissions of various types of vehicles is presented in **Table 7.8**. However, the extent of these impacts, at any given point of time will depend upon the rate of vehicular emission within a given stretch of the road; and the prevailing meteorological conditions. The impacts will have strong temporal dependence as both of these factors vary with time. The temporal dependence would have diurnal, seasonal as well as long-term components.

Emissions	Emission Fa	ctors in gm/K	m/Vehicle							
1. For Diesel Vehicles										
	Speed (Km/hr)									
	30	40	50	60	70	80

NO _X	0.58	0.5	0.5							

Table 7.8.Rate of Emissions of Various Types of Vehicles

Source: Indian Institute of Petroleum

7.4. Land Environment – Impacts

7.4.1. Impacts on Topography

Construction Phase

In rolling terrain, cutting and leveling will alter the existing topography. In case of hilly terrain cutting of hill sections is required, which can alter the existing topography to a greater extent. Construction of embankments results in alteration of geography of the area. Removal of soil and earth strata at bridge approaches will cause changes in topography. Further, extraction of construction materials from selected borrow area, quarry location and sand mining areas will alter the terrain, affects the aesthetics of landscape and alters the contours of the geographical region. The overall topography of the area is not going to alter due to these minor changes providing positive impacts. List of embankment raising sections are listed in **Table 7.11**.

Sl. No.	Design Chainage		Length of raising	Reason for raising					
51. 140.	From	То	section (m)	Reason for faising					
Tiruchengode to Paramathy Section of Road No. 2 (SH 86)									
No new retaining wall or high raised embankments are proposed in this project corridor									
Section I – Malliyakarai – Rasipuram Section of Road No. 4 (SH79)

				proposed					
2	4+900	5+020	1	Correcting the existing vertical profile					
3	6+630	6+880	1	Realignment					

 Table 7.9.
 List of Embankment Raising Sections

Operational Phase

No significant impact is envisaged on topography during operation phase.

7.4.2. Impacts on Geology

Likely impact on the geological resources will occur from the extraction of materials (borrow of earth, granular sub base and aggregate for base course and bridges). These materials will be procured from the authorized suppliers and prevalent rules will be followed for borrowing soil, sand and aggregates. Hence, the impacts on general geology of the region are insignificant. At the construction sites, no blasting is proposed, therefore, there will be no added impact on the geology of the area.

7.4.3. Impacts on Seismology

The construction and operation of the project roads will not lead to any adverse impact on seismology setting of the regional environment. On the contrary, the seismic events that could occur on the region could damage the road and structures if not constructed as per the specification recommended for the seismic zone. Present upgradation will incorporate both, existing structures will be checked & compiled and new structures will be designed earthquake resistant. Project roads falls under zone II & zone III, i.e. least to moderate active categories as per the seismic zone classification of India.

7.4.4. Impacts on Lands

Loss of land: One of the major 'local' impacts due to highway project is upon the local land resources required for widening and improvement of the project road. There are stretches along the corridors where acquisition of agricultural land has been unavoidable due to non-availability of sufficient right of way to accommodate the proposed cross section.

Generation of Debris: The major source of debris generation is dismantling of existing cross drainage structures and road side residential and commercial structures.

Soil Erosion: Erosion of topsoil can be considered a moderate, direct and long-term negative impact resulting from the construction and maintenance of roads. The potential for soil erosion is high during the construction stage. Starting with clearing and grubbing of vegetation is exposing raw soil for erosion. The construction of new fill slopes for grading and bridge-end fills also exposes large areas to erosion, if protection methods are not implemented. Finally, during the operation or maintenance phase of highway development, erosion can continue to occur in areas not vegetated. Fills are exposed to long-term exposure to water and wind. Although soil erosion occurs sporadically on highway corridors, the sites most affected are generally bridge approaches, fills and over-steep banks.

Road Slopes and Spoils

Erosion problems may occur on newly constructed slopes and fills depending on soil type, angle of slope, height of slope and climatic factors like wind (direction, speed and frequency) and rain (intensity and duration). Since slope protection methods (re-vegetation or stone pitching) form part of good engineering practice, and have been incorporated into the detailed design for the roads, erosion concerns should be minimised. However, failure to maintain soil erosion protection can reduce the security of high road embankments and add siltation to the rivers during the monsoon season.

Construction of new Bridges and Culverts

Along each corridor rehabilitation / reconstruction / widening of a number of major and minor bridges and culverts is planned. Construction of new bridges involves excavation of river bed and banks for the construction of the foundation and piers. If the residual spoil is not properly disposed off, increased sedimentation downstream of the bridge may take place during the monsoon. Also, the bridge approaches fills require armouring to ensure gullying and slumping are minimised.

During the construction period some amount of drainage alteration and downstream erosion / siltation is anticipated. Some of these alterations may be because of construction of temporary traffic detours / diversion. Except for these temporary works, in almost all cases there should be an improvement in the drainage characteristics of the surrounding area due to improved design and added culvert / ditch capacity. Changes in the drainage pattern due to the raising of the road profile has not been discussed in specific cases, as the likely impact is not adverse and does not warrant mitigation (as the road design itself takes care of cross-pavement drainage). New culverts are being incorporated in the project roads not only to prevent over-topping but also to maintain equal water distribution on either side of the road. In fact, the bridges and culverts, as designed, are an automatic enhancement to the local environment (flooding, stagnation, scour, torrent run-off velocity – all would be reduced as a result of this project).

Quarries and Borrow Areas

The excavation of quarries and borrow pits used for obtaining soil and aggregate materials for road construction can cause direct and indirect long-term major adverse impacts on the environment. While loss of productive soil is the most direct negative impact, other significant indirect negative impacts can also occur.

Since most of the construction materials would be available from existing quarries nearby, relatively few new borrow areas will be required.

One of the long-term residual adverse impacts of borrow pits not reclaimed is the spread of malaria. Mosquitoes breeding and multiplying in stagnant water that collects in these pits can affect humans in villages and towns close to the features.

7.4.5. Contamination of Soil

Construction Phase

Soil contamination would take place to a small extent due to spillage of construction material, oil, fuel, grease and asphalt around the construction yards. Especially at vehicle & DG sets fueling areas, where soil contamination occurs predominantly. Dumping of scarified materials to the adjacent agricultural land may lead to contamination of top soil. Leachates of the scarified asphalt material can spoil the soil quality to a marginal depth. Disposal of construction waste and domestic waste in unscientific way may result in loss of productive land.

Operational Phase

Better access can lead to conversion of agricultural land to commercial and residential purpose close to project road, especially in rural areas. This may result in loss of productive land and agriculture produce. Erosion of embankment formation may occur near low lying areas and near bridge approaches, during monsoon. Deterioration of borrow areas may happen if not rehabilitated properly.

7.5. Water Environment – Impacts

Due to the proposed project, there will be some direct and indirect long-term impacts on the water resources. Table below presents the major adverse impacts on the water resources and the indicators chosen to assess the impacts for the study.

Impacts Due To Construction	Indicators				
Loss of water bodies	Area of water bodies affected				
Loss of other water supply sources	Number of wells affected				
Alteration of drainage, run off, flooding	No. of cross drainage channels				
Depletion of Ground Water recharge	Area rendered impervious				
Use of Water Supply for Construction	Quantum of water used				
Contamination from fuel and lubricants	Nature and quantum of contaminators				
Contamination from improper sanitation and Waste Disposal in Construction Camps	Area of camp / disposal site and, proximity to water bodies / channels				

 Table 7.10A.
 Impacts on Water Resources Due to Construction Activities

7.5.1. Loss of Water Bodies

The project road passes through the dry area of Tamil Nadu with mean average rainfall of 600 - 1600 mm. Due to non-availability of water, many formers along the project corridors are practicing seasonal cultivation.

7.5.1.1. Surface Water

Construction Phase

The project roads are crossing rivers, canals and streams on its way and are abutting ponds and tanks, wells, bore wells, etc. Disposal of construction debris near the vicinity of water bodies may cause stagnation / diversion of natural drainage. Water supply units present adjacent to project road within the proposed RoW will be impacted. **Table 7.12B** and **Table 8.2** present the details of the existing surface water resources and the possible impacts due to project. Drawing of water for construction camps for domestic use from local water sources may disturb water supply use for the local inhabitants. Construction activity at bridge and culvert locations may cause water pollution.

Operation Phase

Lack of proper drainage arrangement may result in soil erosion subsequently leads to turbidity and siltation of nearby natural water bodies. Spillage of edible oil, crude oil, lubricants and other hazardous chemical due to road accidents close to natural drainage will lead to change in water quality. Unscientific disposal of debris and construction materials in low laying area shall lead to flooding during rainy season. Water shall be utilised for maintenance of trees planted along project road.

7.5.1.2. Ground Water

Construction Phase

Extraction of ground water for construction activities and domestic use of labour camps will result in depletion of local ground water table. Sources of ground water such as open wells, hand pumps and deep tube wells will be affected due to widening of project road at specific locations. **Table 7.12C and Table 8.3** present the details of the existing water resources and the possible impacts due to project. Selection of construction camps adjacent to open well will lead to contamination of ground water.

Operation Phase

Proposed construction of embankments at rolling terrain will reduce the permeability of the unpaved shoulder and will further decrease the ground water recharging rate to a great extent due to surface runoff. Paved surface of the road will further reduce the percolation of runoff water and decrease the ground water recharge.

Table 7.12C. Impact on Ground Water Bodies

7.5.2. Alteration of Cross Drainage

During the construction period some amount of drainage alteration is anticipated, due to construction of temporary traffic diversions. Table below elaborates the need of diversion for the reconstruction and new proposed bridges.

 Table 7.11.
 Details of Bridges Reconstruction

With these widening of minor bridges and bridging of existing causeways, there will be an improvement in the drainage characteristics of the surrounding area and the alteration will be temporary in nature. All the diversions will be provided with adequate waterway for drainage.

7.5.3. Run-off and Drainage

Sediment accumulation in water bodies decreases the storage capacity for road run-off. To worsen the situation road construction activities can lead to increased run-off both, during the construction and operational stage. This can be considered a high adverse impact.

Phase of Construction	Reason	
Construction phase	The removal of vegetation and compaction of soil can lead to	
	increased run-off during the monsoon	
Operational phase	The area of open ground lost and added impervious black top surface increases the amount and rate of run-off.	

7.5.4. Water Requirement for Project

The water requirement for the construction depends on the climatic conditions, type of equipment, type of material available, mix design, type of construction plant and number of people working on the project. With the following assumptions, approximate water quantity required for the project has been calculated.

- 8-10% of weight of soil for the embankment construction
- 7-8% of weight of soil for sub grade construction

- 5-6% of weight of GSB materials for GSB and WMM
- 150 litres/ cum for concrete.

The water requirement has been assumed based on previous project experience and on the strict quality control basis. Domestic requirement of 150 liter per worker has been assumed. Details of water requirement assessed for the project are presented in **Table 7.12**.

 Table 7.12.
 Requirement of Water for Proposed Construction Works

Sl. No.	Purpose	Cum/day
1	Permanent works (Total quantity in cum)	110,000 (2 Years) or 150 kl/day
2	Dust Suppression at work zone in (cum/day)	25
3	Curing (cum/day)	8
4	Laboratory (cum/day)	5
5	Haul Roads (cum/day)	15
6	Crusher (cum/day)	10
7	Plant Cleaning and workshop washing in (cum/day)	8
8	Domestic Purpose in (cum/day)	15
Total Re	quirement (cum/day)	236

Daily water requirement for the permanent works has been calculated assuming the construction period for 2 years.

7.5.5. Impacts on Water Quality

7.5.5.1. Surface Water Quality

Construction Phase

There are various water bodies such as rivers, streams (nalas) and canals crossing / abutting the project roads as presented in **Table 4.16.** Some impacts are anticipated on the water quality of these water bodies during the construction phase if water is present in water bodies. Discharge of untreated waste water generated from construction camps, labour camps to nearby water bodies will lead to deterioration water quality. Runoff from hill slopes, embankments and earthen shoulder may increase the chances of soil erosion, which result in turbidity and siltation of water bodies. Cleaning of construction machineries, equipment and vehicles shall further deteriorate the water quality.

Operation Phase

Impacts during operational phase are comparatively lesser than construction phase. The common impact during operation stage is spillage of petroleum and other hazardous materials due to road accidents, which may deteriorate the water quality to a considerable extent.

7.5.5.2. Ground Water Quality

Construction Phase

Selection of construction camps adjacent to open well will lead to contamination of ground water due to unscientific usage of water near open wells. Other than this, no other impacts are anticipated on ground water quality.

Operation Phase

No activities of the project during operation phase are expected to interfere with the ground water characters of the region and hence the impacts on the ground water quality are not anticipated.

7.6. Noise Environment – Impacts

Construction Phase

During the construction phase of the road, the major sources of noise pollution are vehicles transporting the construction material to the construction yard and the noise generating activities at the yard itself. Mixing, casting and material movement are primary noise generating activities in the yard and will be uniformly distributed over the entire construction period. Construction activities are expected to produce noise levels in the range of 80 - 95 dB (A).

The construction equipment will have high noise levels, which can affect the personnel operating the machines. Use of proper Personal Protective Equipment (PPE) such as ear muffs will mitigate any adverse impact of the noise generated by such equipment.

The noise levels in the working environment are compared with the standards prescribed by Occupational Safety and Health Administration (OSHA-USA) which in-turn are being enforced by Government of India through model rules framed under the Factories Act. The acceptable limit for each shift being of 8-hour duration; the equivalent noise level exposure during the shift is 90 dB (A). Hence, noise generated due to various activities in the construction camps may affect workers, if equivalent 8-hour exposure is more than the safety limit. ACGIH (American Conference of Government Industrial Hygienists) proposed an 8 hour Leq limit of 85 dB (A). Exposure to impulses or impact noise should not exceed 140 dB (A) (Peak acoustic pressure). Exposure to 10,000 impulses of 120 dB (A) is permissible per day.

The noise likely to be generated during excavation, loading and transportation of material will be in the range of 90 to 105 dB (A) and this will occur only when all the equipment operate together and simultaneously. This is however, is a remote possibility. The workers in general are likely to be exposed to an equivalent noise level of 80 to 90 dB (A) in an 8-hour shift, for which all statutory precautions should be taken into consideration.

Wherever the project road passes through populated areas at various villages, urban areas, sensitive receptors such as schools, colleges, hospitals and religious institutions along the road, people in these places will be exposed to high noise levels. Sensitive receptors along the project road are presented in **Table 7.13A.** Source of noise pollution

Sr. No.	Phase	Source of Noise pollution	Impact categorization
1	Pre- construction	Man, material & machinery movements establishment of labor camps	all activities will last for a short duration and also shall be localized in nature
		onsite offices, stock yards and construction plants	hature
2	Construction Phase	Plant Site stone crushing, asphalt production plant and batching plants, diesel generators etc Work zones	Plant Site: Impact will be significant within 500m. Work zones: Such impacts again will be of temporary nature as the construction site will go on changing

Sr. No.	Phase	Source of Noise pollution	Impact categorization	
		Community residing near to the work zones	with the progress of the works.	
3	Operation Phase	due to increase in traffic (due to improved facility)	will be compensated with the uninterrupted movement of heavy and light vehicles till the facility reaches the level of service C.

Operation Phase

Uninterrupted movement of heavy and light vehicles at high speeds may cause increase in ambient noise levels on the project roads. It may have negative environmental impacts on the sensitive receptors such as temples, mosques, schools, hospitals etc close to the project road. Variation of noise level with vehicle speed is given in **Table 7.14**.

Table 7.14.	Noise Level Variation with Vehicle Speed
-------------	--

Speed (Km/h)	Noise Levels in dB (A) at 15 m					
	Cars*	Trucks	Buses	2/3 Wheelers		
40	59.0	76.0	76.0	61.0		
50	63.0	80.0	80.0	66.0		
60	65.0	81.0	81.0	68.0		
70	68.0	81.5	81.5	70.0		

Noise Levels in dB (A) at 15 m					
Cars*	Trucks	Buses	2/3 Wheelers		
70.0	82.0	82.0	72.0		
72.0	83.0	83.0	74.0		
74.0	83.5	83.5	76.0		
	Cars* 70.0 72.0	Cars* Trucks 70.0 82.0 72.0 83.0	Cars*TrucksBuses70.082.082.072.083.083.0		

*Noise levels for new cars are 5dB(A) or lower.

With the proposed improvement of the project road, the residential areas along the stretch on either side are likely to experience high day and night time noise levels. These noise levels significantly vary with vehicle speed as presented in **Table 7.14**.

7.7. Flora and Fauna – Impacts

The major impact in the project on flora involves the removal of trees to permit construction and to provide clear zone for safety of the road users. **Table 7.15** presents the major adverse impacts on the flora & fauna and the indicators chosen to assess the impacts for this study.

 Table 7.15.
 Impacts on Flora and Fauna due to Construction Activities

Impacts due to Construction	Indicators
Loss of forest area/wild life sanctuary	Area of forest affected
Alteration of Wild life passage	Locations of wild life crossing of project road
Tree felling	No. of trees to be felled
Vegetation	Area of vegetation loss
Cattle Grazing Ground	Area and location of grazing ground.

7.7.1. Forest Area along the Project Roads

Construction Phase

Section I of Corridor 4 is abutting two Reserve Forests, Pudupatti East Beat RF on RHS (from Km 22+600 to Km 23+900) and Bailnadu RF on LHS (from Km 24+500 to Km 25+000). Section I of Corridor 5: Mohanur to Namakkal section of SH 95 is abutting Saravumalai RF on LHS (from Km 10+700 to Km 11+000). Since there is no diversion of forest land, no permanent impact is envisaged due to this project. However, impacts are anticipated on wildlife during construction phase due to noise generated by construction machineries and regular movement of construction vehicles. In the absence of proper accident management system, accidents of vehicles carrying hazardous chemicals during construction and operation phases will be hazardous to flora and fauna of the region.

7.7.2. Impacts on Wildlife

No wildlife crossing is found along the project corridor.

7.7.3. Tree Cutting

Construction Phase

Trees located within the formation width need to be removed for efficient construction workmanship and more importantly to prevent collision with the trees, in the case of accident. Roadside trees with strong and rigid stems can pose safety hazards. Some trees obstruct clear sight distances. Others have a propensity to overturn when old and are potential safety hazards depending upon age and decay condition. All such trees that are safety hazards need to be cleared.

There will be a significant direct impact on cutting of the roadside trees, it includes

- Loss of shades
- Loss of tree products
- Loss of birds nesting places
- Removal of roadside trees will also reduce comfort levels for slow moving traffic and pedestrians
- Removal of trees will facilitate erosion and contribute to the loss of micro-ecosystems developed on the roadside.
- Besides, these trees act as noise barrier, dust absorption, air purifier, etc.

A detailed tree inventory of all the existing trees was carried out within the corridor of impact. Due care has been given in alignment design to reduce / minimize the loss of flora and green tunnels. Corridor wise details of the trees to be removed are summarized in **Table 7.16.** The major trees affected are Tamarind, Neem, Coconut, Palm tree etc.

 Table 7.16.
 Summary of Trees to be felled for the Proposed Improvement

Source: Reconnaissance Survey conducted by CDM Smith

Cutting of trees for fuel by workers, especially near their camps is of major concern. Therefore, adequate training of the workers and availability of alternate fuel are to be ensured by the Contractors.

Operation Phase

The overall aesthetic of the area shall improve with landscaping and avenue plantation in the project stretch. Roadside plantation shall be restored and maintained as per compensatory tree plantation plan.

7.7.4. Removal of Vegetation

Construction Phase

Clearing and grubbing of the area is the foremost requirement to start the construction activities in accordance with MoRTH specifications. The impacts due to removal of vegetation includes

- Dust generation during windy atmosphere
- Loss of productive top soil

• Soil erosion during rainy season, may lead to water contamination

Operation Phase

The aesthetic of the project area shall improve with landscaping. No major impacts are identified during the operation phase.

7.7.5. Cattle Grazing

No cattle grazing grounds have been found along the Corridor of Impact.

7.8. Socio-Economic Environment – Impacts

7.8.1. Analysis of Positive and Negative Impacts on Present Status of Livelihood

7.8.1.1. Positive Impacts

The accessibility and connectivity increase as these corridors are the major connectivity between various towns in Namakkal district. Thus, the time of travel between these places shall reduce significantly. With the advent of the two-lane highway the vehicle operating and maintenance cost is expected to go down substantially. These benefits can be attributed to smooth and even roads and low congestion. Saving in fuel consumption can be attributed to low congestion and relatively less travel time due to proposed improvement. The proposed road improvements shall also include general amenities like bus bays, pedestrian passes, road sign boards, street lights etc. and thus overall facilities to the road commuters shall improve. The proposed project is expected to improve the quality of life of the people residing in the project influencing area in terms of their economic, social and health status. Land value in the nearby areas of the proposed landscaping and avenue plantation in the project stretch. During the construction stage of the project, both skilled and unskilled labours will be employed from the local villages to enhance the livelihood and economic standard of the people.

7.8.1.2. Negative Impacts

Improvement of proposed project improvements require acquisition of productive agriculture land, demolition of commercial and residential building, felling of trees required for up-gradation of road and shifting of public facilitating utilities such as electric poles, electric transformers, telephone lines, water supply lines, open and underground sewage lines etc. some of the community resources such as religious structures, educational institutes, panchayat meeting places and cattle grazing will be affected.

Table 7.19. Impact on Social and Cultural Environment

Environme	Project Activities										
ntal Component	Planning and Design Phase	Pre Constru	ction Phase		Constructi	on Phase				Operation	Phase
Affected	Design decisions	Land acquisition	Removal of Structures	Removal of trees & vegetation	Earth works including quarrying	-	Vehicle & machine operation & maintenance	Asphalt and crusher plants	Labour Camps	Vehicle operation	Indirect Induced development
Agricultural land	-	Change in land prices	Loss of land economic value	Loss of standing crops	Loss of productive land	-	-	Dust on agricultural land reduce productivity	-	-	Conversion of Agricultural Land
Buildings and built structures	-	-	Loss of structures, Debri generation, Noise and Air pollution	-	Noise, vi- bration may cause damage to structures	-	Noise, vibration may cause damage to structures	Dust accumulation on building and structure	-	Vibration and noise	Change in building use and characteristics
People and Community	Anxiety and fear among community	-	Displacement of people, Psychological impact on people, loss of livelihood	Loss of shade & community trees, Loss of fuel wood and fodder, Loss of income	Noise and Air pollution	Odour and dust	Noise and Air pollution, Collision with pedestrians livestock and vehicles	discomfort	Community clashes with migrant labour	Noise pollution, Risk of accident	Induced pollution
Cultural Assets	-	-	Displacement loss of structure from RoW	Loss of sacred trees.	Noise, vibration may cause damage to structure	-	Damage from vibration & air pollution	Dust accumulation	-	Damage from vibration & air pollution	-
Utilities and Amenities	-	-	Interruption in supply	-	-	-	Damage to utility and amenities	Dust accumulation on water bodies	Pressure on existing amenities		-
Labour's Health & Safety	-	-	-	-	Increase of stagnant water and disease	Asphalt odour and dust	Collisions with vehicles, pedestrians & livestock	Impact on health due to inhale of dust	Increase in communicab le diseases	Collisions pedestrians & livestock	-

7.8.2. Fear of Uncertainties Regarding Future

Land and property owners are subjected to suffering regarding uncertainties of the extent of loss and the nature of compensation. These involve,

- Uncertainty of the amount of land / property to be acquired
- Time of acquisition and evacuation
- Extent and amount compensation
- Provision of alternative land or job etc.

7.8.3. Inducement of Land Prices

Once the project becomes common knowledge, there may be a danger of unscrupulous speculators moving into purchase land at what might seem to be advantageous prices, prior to the commencement of the official procedures. Such impacts are more likely to occur in the case of urban fringe areas during the design and pre-construction phase.

7.8.4. Inducement of Squatter Influx

Squatters may attempt to occupy land along and adjacent to the proposed alignments, in the hope of receiving compensation or some other inducements to leave when construction commences. Such squatters could cause undue pressure on local resources such as water and firewood, which could result in conflicts with those who are harvesting the resources presently.

7.8.5. Loss of Utilities and Amenities

Site clearances involves removal of various assets, utilities and amenities that are,

- Natural (trees, bushes, and grass lands), and
- Physical structures (public or private assets and utilities)
- Relocation of utilities like electricity, water and telephone lines

For people dependent on the above, this constitutes economic loss for some time before these are restored to their previous status. These have been further discussed in RAP.

7.8.6. Public Health and Safety

a) Impacts on Public health and safety may arise during the phases of pre-construction, construction and operation phases. During the pre-construction and construction phases, dismantling of the structures for CoI clearance and road construction activities may result in the following health hazards:

- Dismantling of properties has psychological impacts on their owners and others associated with them.
- Debris generated on account of the above mentioned activities.
- b) Labour Camps during construction period can bring the following problems.
 - In the case of non-local labour (if so is arranged by the contractor), labour camps are set up at one or more sites adjacent to the alignment, and at some ancillary sites, like

aggregate quarries. These labours hired from outside can have clashes with the local population on account of cultural and religious differences. The influx of a large work force to an area, already hard pressed for basic services (medical services, power, water supply, etc.), can impose additional stress on these facilities.

- If alternative fuels are not made available to the workforce, there is a likelihood that trees will be cut down for cooking or heating purposes.
- Insanitary conditions in the labour camps might also result in impact on health of labours as well as the local population. Transmission of diseases is also facilitated by the migration of people. During the construction phase work, crews and their dependents may bring with them a multitude of communicable diseases including sexually transmitted diseases (STDs) like AIDS. This is more so if the nature of the project requires more male-workers, who have migrated from other parts of the state or country.
- c) Allied activities during construction period may cause local disruption.
 - During road construction allied activities like quarrying and crushing operations, traffic diversions, etc., may cause disruption of social and economic life of the local population of the nearby areas.
 - Dust and noise generated in crushing and blasting operations may cause nuisance to the nearby communities.
 - Traffic jams and congestion, loss of access and other road accident risks, as a result of diversion of traffic and construction work on road.

There will be some impact on land during construction, limited mainly to temporary acquisition to cater to road diversion or traffic detours and establishment of labour camps.

- d) Accidents and Safety
 - Although the design speeds have been kept lower in the major settlement areas, some amount of severance is expected in the rural areas. Especially where the residential area is on one side and their agricultural land and other facilities are on the other side of the highway. Schoolchildren and ladies carrying pots full of water from the water sources (ponds/wells) also get exposed to this risk. In rural areas, it was seen that cattle also cross the highways near the settlement.

7.8.7. Resettlement of People

People, displaced from their homes and agricultural lands on account of the project, shall induce additional pressures to the local resource base. These include pressure on:

- Water resources in areas where availability is low,
- Grazing lands and fuel-wood,
- Public services such as schools and medical facilities.
- This is critical since number of displaced persons being squatters is larger than legal landholders formally displaced.

7.8.8. Land Use Changes

Construction Phase

Upgradation of project road requires acquisition of agricultural land, commercial/ residential land and forest land, wherever the existing RoW is not accommodating design scheme. Loss of productive agricultural land may result from the establishment of construction camps, batch mix plant and hot mix plant, quarry and borrow area. This results in minor change in agricultural yield due to project activities. Temporary change in land use at fly over, bridge and culvert locations shall be encountered to facilitate the existing traffic by alternate routes. Land selected for borrow and quarry area will change the land use pattern permanently.

Operation Phase

Better access can lead to conversion of agricultural land to commercial and residential purpose close to project road, especially in rural and urban areas. This leads to decrease in agriculture production and loss of productive land. Aesthetics of the region shall change permanently. The urban fringe area along the project roads will be subjected to ribbon development.

7.8.9. Disturbance to the Road Side Services

Along the highway, near settlements, small shops get attracted to serve the local people as well as the highway uses. A composite socio-economically inter-dependent has been developed as a consequence. It is likely that due to implementation of the project some of the shops may get displaced. This would cause negative impact on the livelihood of the people as well as loss of service to the local people and road users.

7.8.10. Removal of Encroachments and Squatters

In order to reduce the number of PAPs, land clearing shall be restricted to within the Corridor of Impact (CoI) which principally lies within the RoW. Width of the CoI varies according to the design and is narrower in the settlement areas, where the numbers of PAPs are likely to be more. However, some amount of land clearing will be essential in several of these stretches.

The potential impacts likely to arise from clearance of encroached residential areas (especially in settlements along the project corridors) may involve loss of valuable residential space to the residents. In the case of squatter settlements, displacement might lead to loss of shelter if adequate measures are not taken for their resettlement. Compensation may not be enough for the affected persons to gain access to shelter. Other impacts include disturbance to family and community life and increased distance from their workplace. In such cases, the displaced persons may again resort to squatting.

The extent of loss in the case of encroached agricultural lands shall be relatively less, in comparison with residential and commercial properties. This because, the encroached lands form only a small part of the total cropped land of the farmers.

Specific Impact

Other socio-economic impacts involve the presence of sensitive community facilities within the Corridor of Impact such as worship places and cultural properties.

7.8.11. Sensitive Community Structures

Utmost care has been taken in finalizing the horizontal and vertical alignment so that the impact on cultural properties could be better avoided than mitigated. Impacts may be anticipated to the religious properties including temples and shrines present along the project roads. The total list of cultural properties identified within the proposed RoW will have experience positive or negative impact is provided in **Table 7.5**.

Besides direct impact, there are many possible indirect impacts due to construction activities, as follows.

- Access to religious places would be difficult during the construction period due to the presence of working areas, consequent traffic management issues, presence of heavy equipment, machineries and numerous workers and controlled sign boards
- Many existing sign boards and information boards will be removed for the construction work. This will make it more complicated for identifying the pilgrimage location, routes and landmarks.
- Safety issues and accidents could go high during the construction period.

7.9. Cumulative Environmental Impact Assessment

Cumulative Impacts are the overall effects causde by the totality of past, present and foreseeable future actions. Cumulative effects can result from incremental changes caused by the interactions between effects within a project and/or the interaction with the effects from other developments. With regard to road schemes, cumulative effects are considered in the following ways:

• Multiple effects from the scheme, and from different schemes of the same or similar type, upon the same resource; such as the effect on a single community of noise from several transport sources.

• **Different multiple effects from the scheme, and from other schemes**, upon the same resource; such as land take and damage due to hydrological change, affecting several sites of the same habitat.

• **Incremental effects** arising from a number of small actions, including ongoing maintenance operations, having developed or developing over time.

This section describs the different developments that have been taken into account and the likely cumulative effects resulting from the interaction with the current project i.e., Phase-I roads under TNRSP-II.

The following projects have been taken into account as being likely to occur prior to the completion or during the construction or operation of the Phase-I roads under TNRSP-II.

- 1. Namakkal-Tiruchengode Road widening to a four-lane road at a cost of Rs 140 crore
- 2. Opening of the Indian Railways (IR) Karur-Namakkal-Salem new broad gauge railway line for freight traffic.
- 3. Construction of railway stations at Mallur, Rasipuram, Puduchatram, Kalangani, Namakkal, Lathuvadi, Mohanur, Vangal and Karur.
- 4. World Bank aided Tamil Nadu Irrigated Agriculture Modernization and Water bodies Restoration and Management (TN IAMWARM) Project in Salem District.
- 5. Potential investment opportunity of around Rs.50 Lakh in Poultry based products in Namakkal, and Elachipalayam region as per the information from Department of Industries and Commerce, Namakkal.

- 6. Potential investment opportunity of around Rs.35 Lakh in Lorry body building and repair in Namakkal and Tiruchengode region as per the information from Department of Industries and Commerce, Namakkal.
- 7. Setting up of Polyster viscose yarn unit at Tiruchengode, in Namakkal district of Tamil Nadu. by Sri Santhanalakshmi Spinners.
- 8. Other rural infrastructure development works by Government of Tamil Nadu.
- 9. Demolition and construction activity as a result of Land Accusation and Rehabilitation of current project.

7.9.1. Cumulative Impacts of Vehicular Traffic at Junctions

There will be temporary direct adverse effects on traffic during construction of Phase-I roads under TNRSP-II particularly at junctions. Simultaneous construction of the railway stations, residential and commercial properties will increase the traffic flow in the short term.

The opening of railway freight corridor will be beneficial for the textile and poultry industries in namakkal district, who will be encouraged to transport their produce through railways. This alternate mode of transport will reduce the overall traffic on the highways but will increase the traffic at junctions due to movement of goods to railway freight handling centers.

The vehicular traffic at junctions will aslo be at strain due to growth of economic activity in Salem and Namakkal districts. Poultry, lorry body building and textile industries are crucial for the economy of this region. As per the estimates of the state and district governments there is still huge potential for the growth of these segments. Expansion of above sectors will significantly increase the vehicular traffic.

The programme for all the above projects is not currently known, so it is not currently possible to predict the level of disruption that may occur. However, if all these projects occur simultaneously, there could be significant cumulative impact. Though it is very unlikely that all the projects will take off at a time, never the less the contractor should be aware of other project activities in the region and plan his activities in a way to reduce impact. Traffic management measures proposed in Chapter 8 of this document and also in EMP will ensure effects are insignificant. The junction improvements that will be taken up in all the major junctions will also aid in reducing the cumulative impact of vehicular traffic at junctions.

7.9.2. Cumulative Impacts on Road Safety

As pointed out in the previous section, simultaneous execution of all the projects will significantly increase the vehicular traffic there by increasing cumulative impact on raod safety. However proposed Phase-I roads under TNRSP-II are wider at places and designed in a manner to increase road safety. Thus the overall impact on road safety post construction phase will be lesser than otherwise. The Contractor should follow all the safety measures proposed in Chapter 8 and in EMP document during the construction phase meticulously to reduce cumulative impact.

7.9.3. Cumulative Impacts on Valued Ecosystem Components (VEC)

A valued ecosystem component (VEC) is an element of the environment that has scientific, economic, social or cultural significance.

As far as the wildlife, forests and geology are concerned the project have no direct impact thus the cumulative impact is also nill. Environmental impact on other valued ecosystem components like air, water, noise, vegetation and social aspects is significant, the cumulative impact could increase if other projects are implemented simultaneously.

Impacts on air quality during the construction phase of the project will be considerable as the amount of work involved in improvement of the road is significant. However, any possible impacts will be transitory. Due to the proposed project, there will be some direct and indirect long-term impacts on the water resources as well as sensitive noise receptors. The major impact in the project on flora involves the removal of trees to permit construction and to provide clear zone for safety of the road users. All these impacts can aggravate if other similar projects are implemented together.

Though it is very unlikely that all the projects will take off at a time, never the less the contractor should be aware of other project activities in the region and plan his activities in a way to reduce impact. Provision of adequate air pollution control equipment, like dust filters and measures like dust suppression by water sprinkling and planting of green belt may help to significantly reduce the impact

On the socio economic front the project has both positive and negative impact. The project roads run through fertile agricultural lands and settlements and hence, the impacts of land acquisition are expected to have significant effect on livelihood and economic activities of the project area. On the other hand accessibility and connectivity increase as these corridors are the major connectivity between various towns in Namakkal district. Thus, the time of travel between these places shall reduce significantly. With the advent of the two-lane highway the vehicle operating and maintenance cost is expected to go down substantially.

As the Karur-Namakkal-Salem railway project is already completed and other proposed projects will not require large scale land accusation the cumulative impact on this front will be minimal. Where as, better road connectivity will lead to economic development of the region. The cumulative impacts of which are difficult to anticipate at this stage.

The activities associated with current project will contribute minimally to the impacts of other current and reasonably foreseeable projects. By adopting suitable mitigation measures as suggested in Chapter 8 and EMP reports the overall impact can be reduced significantly.

Chapter 8. Impact Mitigation and Enhancement

8.1. Avoidance, Minimization, Mitigation, and Enhancement

Prevention or avoidance of impact is better than mitigation of impact. Hence, avoidance and reduction of adverse impacts approaches were adopted without jeopardizing the road safety concern, during the design stage through continued interaction between the design and environmental teams. This is reflected in the designs of the horizontal & vertical alignment, cross sections adopted, construction methods and construction materials. In-depth site investigations have been carried out so that sensitive environmental resources are effectively avoided, leading to the environmentally best-fit alignment option. The EIA mechanism applied to the project comprises following key principles in the following order of priority.

- Avoid adverse environmental impact
- Minimise and control adverse environmental impact
- Mitigate adverse environmental impact
- Enhance the environment

Matrix method was followed for the identification and evaluation of impacts. The activity – impact identification matrix is presented as **Annexure 7.1**. Environmental Management Action Plan (EMAP) for the mitigation of impacts and environmental enhancement is presented in the standalone Environmental Management Plan (EMP) Reports for each project road.

8.2. Air Environment – Mitigation Measures

Motor vehicles have emerged as one of the major sources of air pollution especially in urban areas. Due to proposed road improvements aimed at enhancing the efficiency of road transport system the number of vehicles on these roads will be increased overtime.

8.2.1. Meteorological Factors and Climate – Mitigation

Construction Phase

Felling of large of trees, laying of pavement and other construction activity may cause temporary impact on micro climate of the project influence area. Other than this, no other significant impacts are envisaged in climatic parameters such as precipitation, wind speed, wind direction, temperature, and relative humidity.

Operation Phase

The objective of the present project is only to improve the existing road. Hence, no changes in climatic conditions are anticipated. If any minor impact do exist due to the proposed improvement, it will be mitigated by compensatory and additional afforestation and avenue plantation. Summary of potential impact and mitigation measures proposed is mentioned below.

Sl. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
1	Meteorological factors and climate	Marginal impact	Due to production and laying of hot bituminous mix.	Avenue plantation Plantation in realignment sections Turfing at major junctions and realignment sections
2a	Air quality - emissions	Temporary and location specific	Shifting of utilities, removal of trees & vegetation, transportation of material	Sprinkling of Water Fine materials to be completely covered, during transport & stocking.
	Pre-	(Dust	Installation of	Plant to be installed in

Sl. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
	construction stage	Generation)	construction plants	Downwind direction from nearby settlement.
2b	Air quality - emissions	Moderate impact	Clearing and grubbing materials dumping brushing of the surface	Air pollution Norms will be enforced, Laborers will be provided
	Construction Stage	(Gaseous pollutants & Dust generation)	access roads to borrow- areas Hot mix plants, Crushers Paving of asphalt layers Labour Camps	mask. Local people will be educated on safety and precaution. on accessing roads, newly constructed embankment etc.
2c	Air quality - emissions Operation	Moderate impact (Gaseous	Air pollutants from traffic Dust emission from tyres	Compliance with future statuary regulatory requirements Auto-technology, vehicular
	Stage	pollutants)	Dust emission nom tytes	fuel quality- improvement
3	Air quality - monitoring		Effectiveness / shortfall (if any) Any unforeseen impact.	Measures will be revised & improved to mitigate/ enhance environment due to any unforeseen impact.

8.2.2. Air Emissions – Mitigation

Construction phase

During the construction stage, there are two major sources, the first one is construction activities at working zones, which cause primarily dust emission and the second one is the operation of the construction plant, equipments and machinery, which causes gaseous pollutants. The specific measures include:

- In order to curb the increased fugitive dust emissions in the area due to vehicular movement raw material transport and borrow area excavation, provisions should be made for sprinkling of water on all the roads in the area of improvement. Sprinkling of water should be carried out at least twice a day on a regular basis during the entire construction period especially in the winter and summer seasons. Special attention should be given in the sections where the alignment passes through village and urban areas. Daily inspection at construction site should be carried out to ensure removal of construction debris to the landfill sites.
- Dust covers/ tarpaulins should be provided to cover construction material loaded on trucks, which will be used for the transportation of materials prone to fugitive dust emissions.
- Water will be sprayed on earthworks, temporary haulage and diversion on a regular basis.
- Construction requiring street closings in heavy traffic areas should be performed during off-peak hours.
- Idling of delivery trucks or other equipment should not be permitted during periods of unloading or when they are not in active use.
- Construction vehicles and machineries should obtain "Pollution under Control" certificate from the concerned regulatory authority.

- The fugitive emission from the construction yards is expected to have significant influence up to 1km distance on the downwind direction under adverse meteorological conditions. Hence, it is essential that the construction yards should be located beyond 1km distance from the human settlements in the predominant down wind direction.
- All stationary equipment should be located as far as practically possible from receptor locations in order to allow dispersion of emitted pollutants.
- Suitable air pollution control measures such as electro static precipitator, cyclone separators, bag filters and scrubber should be adopted for hot mix plants, batching mix plants to avoid fugitive emissions.
- Construction workers should be provided with Personal Protective Equipments.
- The construction operations during nights should be carried out under restricted conditions. The work schedule and the operation time of each machine should be suitably modified so as to have limited construction activity to exercise a control on the ambient air quality levels.
- Proper care should be taken for storage of furnace oil, Light Diesel Oil (LDO) etc.
- Air pollution monitoring plan has been delineated for construction phase separately for checking the effectiveness of the mitigation measures adopted during the construction phase of the Contract.

Operation Phase

As indicated in previous chapter, the air pollutant will be form vehicular movement on road and dust emission. As such the national and international bodies are quite active in controlling the air pollution through emission limit, auto technology and fuel quality, which will counter the increase in air pollution due to increase in traffic during operation phase. Additional measures proposed are below.

- As soon as construction is over the surplus earth should be utilised to fill up low-lying areas. In no case, loose earth should be allowed to pile up along the alignment.
- During operation stage, the most effective control methods of air pollution due to vehicular emissions is to use fuel efficient engines, introduction of catalytic converters for petrol vehicles and use of smoke traps for diesel vehicles.
- It should be made compulsory for all vehicles to adhere to the engine maintenance schedules and standards to reduce air pollution due to vehicular emissions.
- Along the project roads, plantation of trees such as Neem, which is known to absorb Hydrocarbons, is recommended. Care should however, be taken to space the trees so that they will not restrict movement of air.
- Development of landscape along the road can reduce concentration of pollutants at the ground level. It is, therefore, recommended that the area available on both sides of the road be used to develop a green belt with dense canopy to minimize the air quality impacts in the downwind regions. Such development will also improve the general aesthetics in the region.
- Air quality monitoring should be conducted as per Environmental Monitoring Plan.
- Other measures such as the reduction of vehicular emissions, ensuring vehicular maintenance and up-keep, educating drivers about driving behavior / methods that will reduce emissions are beyond the scope of project, but will be far more effective in reducing the pollutant levels.

8.2.3. Air Quality Monitoring

Apart from provision of the mitigation measures, their effectiveness and further improvement in designs to reduce the air pollution with increase in traffic shall be monitored. The monitoring plan shall be functional in construction as well as in operation stages. The frequency, duration and responsibility will be as per the EMAP. Any value/result not within standard/acceptable values of National Ambient Air Quality Standards will be reported to the Engineer, for remedial measures.

8.3. Land Environment – Mitigation Measures

Land acquisition, soil erosion, and contamination of soil have emerged as major sources of impacts to land, especially in urban areas and nearby watercourses. Due to proposed road improvements aimed at enhancing the efficiency of road transport system, which will result in economic growth in the region overtime. Summary of potential impact and mitigation measures proposed is mentioned below:

Sr. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
1	Change in Topography	Marginal impact	Due to embankment raising.	Embankment rising to relieve water logging.
2	Change in Geology	Direct , long term, negative impact	Extraction of materials (borrow earth, coarse & fine aggregates).	no blasting is envisaged quarry redevelopment plan need to be enforced
3	Change in Seismology	No Negative Impact		Cross drainage structures are checked and complied with the seismological settings of the region (Zone)
4	Change in Land environment			
a	Loss of land	Direct, long- term negative impact	Land Acquisition Change in land use pattern	Land acquisition to be minimized with provision of Retaining walls.
b	Generation of Debris	Negative Impact	May contaminate air, water and land, if not disposed properly.	disposed properly to avoid contamination
с	Soil Erosion	Moderate, direct, long- term negative impact	Road slopes and spoils Construction of new bridges and culverts Quarry and Borrow areas	Embankment protection. For Emb. ht. >3m Stone pitching, Emb. ht. <3m Turfing. Residual spoil need to be disposed properly. Silt Fencing need to be provided. Quarries need to be reclaimed
5	Contamination of Soil	Direct, long term negative impact	Scarified bitumen wastes Oil & diesel Spills Emulsion sprayer and laying of hot	Hazardous Wastes (Management and Handling) Rules, 1989 to be enforced. Oil Interceptor will be provided for accidental spill of oil and diesel.

		mix Production of hot mix and rejected materials	Rejected material will be layed in village roads or as directed by engineer.
		Residential facilities for the labor and officers Routine and periodical maintenance	Septic tank will be construction for waste disposal.
6	Soil quality - monitoring	Effectiveness / shortfall (if any) Any unforeseen impact	Measures will be revised & improved to mitigate/ enhance environment due to any unforeseen impact.

8.3.1. Change in Topography – Mitigation

Construction Phase

- Care shall be taken during embankment construction and cutting process, so that the natural drainage pattern in the areas will not be affected and adjacent flora should not be affected.
- On high terrain, construction of retaining wall should be carried out by adopting suitable scientific technique so that minimum changes can occur on geography.
- Rehabilitation of borrow area and quarry area shall be carried out in order to control the water logging problem and to avoid the soil erosion and landslides of the adjacent area.
- Guidelines presented in IRC:SP -48-1998 Hill Road Manual should be followed for construction of road in hilly sections

8.3.2. Change in Geology – Mitigation

Construction Phase

No new quarry has been proposed for the project requirements. Only existing, live, licensed quarry will be used as source of coarse and fine aggregates. It will be ensured that the aggregates procured during construction stage will be from the authorized or licensed suppliers only. In case of use of any new quarry by contractor, the instruction / procedure as detailed in **Annexure 3.3** of EMP Report will be applicable. The instruction / procedure for taking earth from borrow areas are detailed in **Annexure 3.4** of EMP Report.

8.3.3. Change in Seismology – Mitigation

As indicated in the previous chapter, there will be no impact on the seismological setting of the region. Rather, as part of the project all the existing structures will be checked and constructed as per seismological requirement of the region in conformity to the IRC 6,2000 guidelines.

8.3.4. Change in Land Environment – Mitigation

Loss of Land: As far as possible, the land acquisition has been kept to the minimum, by restricting the geometric improvement within the existing right of way. Details of the land required for project

road up-gradation is presented in **Table 7.2.** However, the land acquisition will be done at sections having width, insufficient to accommodate the approved cross-sections & geometric improvements. The land acquisition would be in accordance with the RAP and entitlement framework. All R&R activities are to be completed before starting the construction.

Debris Generation: Due to the removal of structures (residential and commercial), pavement scarification and cross drainage structures, lot of debris will generate, which need to be disposed properly to avoid contamination of land and water. For safe and environmental friendly disposal of waste debris, instruction/procedure has been specified in **Annexure 3.5** of EMP Report.

Soil Erosion: could cause severe negative impact if not dealt with, in time, as this harms the environment in two ways, firstly it erodes the top soil and secondly it spoils the resource where it settles, mostly water course. Hence, soil erosion cause loss of top-soil and contamination of water bodies/sources/channels. Mitigation measures proposed are below.

Construction Phase

- To prevent the soil erosion from embankment, the slopes have been restricted to some extent.
- Turfing of road embankment slopes, development of compensatory afforestation, Borrow area rehabilitation will control the soil erosion to a great extent.
- The topsoil from all areas of cutting and all other areas to be permanently covered, shall be stripped to a specified depth of 150 mm and stored in stockpiles of height not exceeding 2m.
- The stored topsoil will be spread back to restore the productivity of the exhausted borrow areas. Also the accumulated soil will be utilized for developing median plantation and raising turfs in the embankment slopes.
- The device for checking soil erosion include the formulation of sediment basins, slope drains etc. Such works and maintenance thereof will be deemed as incidental to the earthwork.
- In borrow pits, the depth of the pit should be regulated so that the sides of the excavation will have a slope not steeper than 1 vertical to 4 horizontal from the edge of the final section of bank.
- If operating from temporarily hired land, it should be ensured that the topsoil for agriculture remains preserved & not get compacted.

Operation Phase

• Compaction and Landscaping to be carried out at all embankment developed locations to control the soil erosion during operation phase.

8.3.5. Contamination of Soil – Mitigation

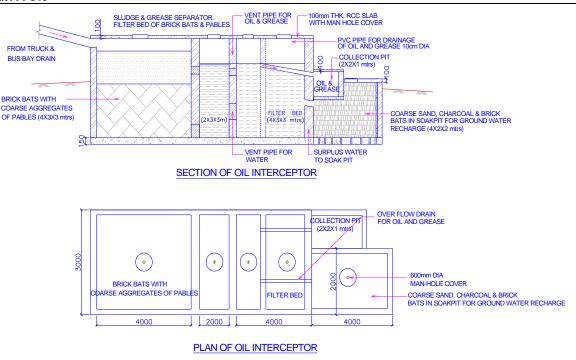

Contamination of soil can spoil the soil and can also contaminate the surface as well as ground water sources. Details of the activities from which the contamination can occur are presented below;

 Table 8.2.
 List of Potential Impacts on Soil and its Mitigation/Enhancement Measures

Potential Impact	Mitigation/Enhancement	
Scarified bitumen wastes, Excess production of hot mix and rejected materials.	Scarified waste and excess/rejected hot mix, with the consent of village authority, will be used in village roads construction.	

Potential Impact	Mitigation/Enhancement
Debris generated from dismantling of structures.	A comprehensive list of instructions/procedures has been suggested in Annexure 3.5 of EMP Report, for contractor to adhere to for safe and environmental friendly disposal of debris.
Maintenance of the machinery and operation of the diesel generator sets on site Oil Spill from the operation of the diesel pumps and diesel storage, during transportation and transfer, parking places,	The base of all machinery, generators will be paved and all the waste/spill will be drained to oil interceptor before discharging. Figure of oil interceptor is presented below.
and diesel generator sets Operation of the emulsion sprayer and	Proper demarcation of the surface to be sprayed
laying of hot mix	/paved will be done to minimize the excessive spread of emulsion/hot mix.
Operation of the residential facilities for the labour and officers	The residential facilities will be provided with proper sanitation, and planed setup of construction camp. Comprehensive plans of Labour camp and construction camp are presented in Annexure 3.1 and 3.2 of EMP Report.
Storage and stock yards of bitumen and emulsion	The base of bitumen/emulsion stock yard will be paved and all the waste/spill will be drained to oil interceptor before discharging.

Oil Interceptor: Oil and grease from polluting run-off is another major concern. During construction, discharge of oil and grease is most likely from workshops, oil and waste oil storage areas, diesel oil pumps, vehicle parking areas from the construction camps. Vehicle / machinery and equipment maintenance and refueling will be carried out so that spillage of fuel and lubricants do not contaminate the soil. The soil is well defined and restricted. An "oil interceptor" will be provided for wash down and refueling areas. Fuel storage will be in proper bunded areas. All spills and collected petroleum products will be disposed off in accordance with MoEF&CC and SPCB guidelines. Fuel storage and fuelling areas will be located at least 300 m from all cross drainage structures and significant water bodies. Schematic diagram of oil interceptor is presented in below.

Drawing No. 8.1: Conceptual Plan of Oil Interceptor

8.3.6. Soil Quality Monitoring

Apart from provision of the mitigation measures, their effectiveness and further improvement in design to reduce the concentration of pollutants in the soil due to construction activity shall be monitored, as contamination of soil is directly linked with contamination of water. The monitoring plan shall be functional in construction as well as in operation stages. The frequency, duration and responsibility will be as per the Environmental Monitoring Plan.

8.4. Water Environment – Mitigation Measures

Due to the proposed project, there will be some direct and indirect long-term impacts on the water resources. Mitigation measures suggested for those impacts are discussed below. Table below presents the major adverse impacts on the water resources and the mitigation measures taken

Sr. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
1	Loss of water Bodies	Major, direct impact	Part or complete acquisition of source of water	Land acquisition to be minimized with provision of Retaining walls. Relocation of ground/surface water sources.
2	Alteration of Cross Drainage	Very Low Impact	One major bridge over existing causeway. Widening of minor bridges and culverts.	widening of minor bridges and bridging of existing causeways, there will be an improvement in the drainage characteristics of the project area
3	Runoff and	Direct	Siltation of water	Silt fencing to be provided.

Sr. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
	drainage	Impact	bodies Reduction in ground recharge. Increased drainage discharge	Recharge well to be provided to compensate the loss of pervious surface. Continuous drain is provided, unlined in rural area and lined in urban areas.
4	Water requirement for project	Direct Impact	Water requirement for construction activity. Water requirement of labour.	Contractor needs to obtain approvals for taking adequate quantities of water from surface and ground water sources. This is required to avoid depletion of water resources
5	Water Quality			
a	Increased sedimentation	Direct impact	increased sediment laden run-off alter the nature & capacity of the watercourse	Silt fencing to be provided. Refer Annexure 3.45 of EMP Report for typical design of sedimentation trenches.
b	Contamination of Water	Direct adverse impact	Scarified bitumen wastes Oil & diesel Spills Emulsion sprayer and laying of hot mix Production of hot mix and rejected materials Residential facilities for the labor and officers Routine and periodical maintenance	Hazardous Wastes (Management and Handling) Rules, 1989 to be enforced. Oil Interceptor will be provided for accidental spill of oil and diesel. Rejected material will be layed in village roads or as directed by engineer. Septic tank will be construction for waste disposal.
6	Water quality - monitoring		Effectiveness / shortfall (if any) Any unforeseen impact	Measures will be revised & improved to mitigate/ enhance environment due to any unforeseen impact.

8.4.1. Loss of Water Bodies - Mitigation

8.4.1.1. Surface Water Bodies – Mitigation

The project road is crossing rivers, canals and streams on its way and is abutting lakes, ponds and tanks, wells, bore wells, etc. Suggested mitigation measures for those impacts identified in **Section 7.5.1.1.** are listed below.

Sl. No.	Chainage (Km.)	Name of Surface water Source	Location (Left / Right)	Distance from ECL (in mts)	Impact	Mitigation / Enhancement

Construction Phase

- All affected community water supply systems such as deep tube wells, open wells, bore, pipelines, taps etc. will be rehabilitated in such a way that local public should not be disturbed for daily water use due to project activity. Relocation of these water systems should be carried out in consultation with concerned government departments and the owners.
- Precautions shall be taken during the construction work of culverts and bridges across these rivers and streams such that the flow in these water bodies is not obstructed.
- At hilly areas, appropriate drainage arrangements with catch drain will be provided to avoid the stagnating of water on carriageway.
- Any embankment work in low lying areas will have provisions for cross drainage for natural drains to ensure that flow is not affected.
- Pitching, stabilization of soil and slope protection measures should be taken up to reduce erosion of soils and to achieve slope stability.
- Arrangement for supply and storage of water shall be made by the contractor in such a way that the water availability and supply to nearby communities remain unaffected. If a new tube-well is to be bored, proper sanction and approval by Ground Water Department is needed.
- The wastage of water during the construction should be minimized. In case of tapping water from community sources, consent to be obtained from local administration for the same.
- Guidelines presented in IRC:SP -42-1994 "Guidelines for Road Drainage" and IRC: 36 1974 "Recommended Practice for Treatment of Embankment Slopes for Erosion Control" should be followed for construction of drainages and embankments for the proposed project.

Operation Phase

- Landscaping to be developed on embankment slopes so that soil erosion and siltation of natural drain can be avoided.
- Appropriate drainage arrangements with catch drains and catch pits designed to safely drain out the hazardous chemicals should be provided.
- For delivery of hazardous substances, permit license, driving license and guarding license issued by Transport Department to be maintained.
- Vehicles carrying hazardous substances should display mandatory safety signs
- In case of spillage, it should be reported to relevant department and their instructions should be followed
- Cleaning of the spills at the accidental site should be carried out as per regulations.

- Care shall be taken by the contractor to avoid the disposal of construction debris and domestic waste along the project area.
- Regular checkup shall be made to clear the blockages and silts from the drainage facilities.
- Permission shall be obtained from Irrigation Department to draw water from natural water bodies for maintenance of avenue trees.

8.4.1.2. Ground Water Resources - Mitigation

Any source of community water (potable or otherwise) such as open wells, ponds, bore wells and tube wells will include the ground water resources. Suggested mitigation measures for those impacts identified in **Section 7.5.1.2.** are listed below.

Sl. No	Chainage (Km)	Name of Ground	Location (Left /	Distance from ECL	Impact	Mitigation/Enha ncement
		water Source	Right)	ECL (m)

Construction Phase

- Requisite permission shall be obtained from the Central Ground Water Board to utilise the water for construction and domestic use.
- Sources of ground water affected during widening will be rebuilt in consultation with concerned govt. officials and the owners.
- Soak pits shall be provided near hand pumps and water tanks present along the project roads for water supply so that spilled water can be used for ground water recharge. This will also avoid unhygienic conditions around such water sources. The drawing for soak pit is given below.

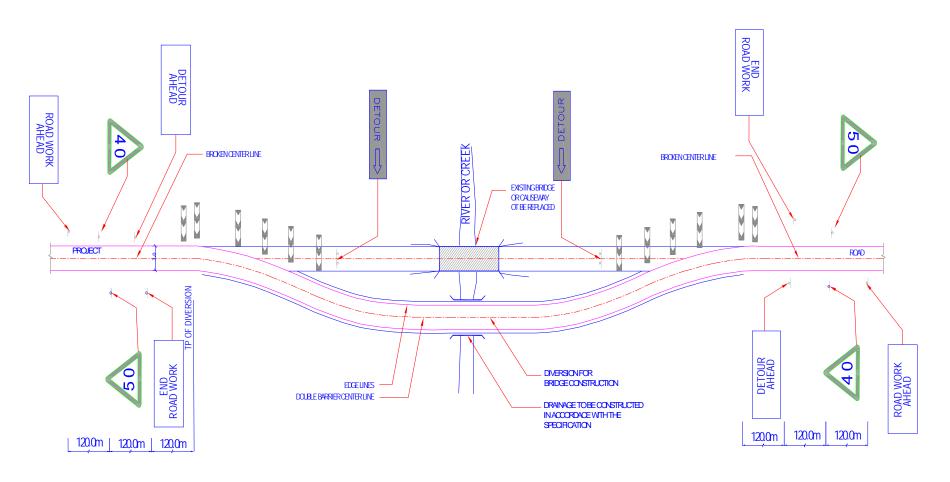

Drawing No. 8.2. Conceptual Plan of Soak Pit for Hand Pumps and Water Tanks (Syntex Tanks) along the roads in Village and Urban Areas

Operation Phase

- Runoff water from project road shall be directed to ground water recharge pits through adequate storm water and catch drainage systems.
- Construction of Ground Water Recharge pit shall enhance the ground water level along the available margin of land within the RoW along the project influence area.

8.4.2. Alteration of Cross Drainage – Mitigation

- All cross drainage structures have been designed to handle a 50-year peak flood level. A detailed hydrological study had been carried to calculate the design discharge.
- Pipe drainages will be provided for diversion roads constructed for the construction of new bridges and culverts (refer drawing 8.3).
- Storm water from all longitudinal and cross drainage works will be connected to the natural drainage courses.
- The contractor will remove obstruction that may cause temporary flooding of local drainage channels, during the construction phase.
- Contractor will be responsible removal of debris due to the dismantling of structure and earth generated due to the excavation of foundation, from the water course before the onset of monsoon.

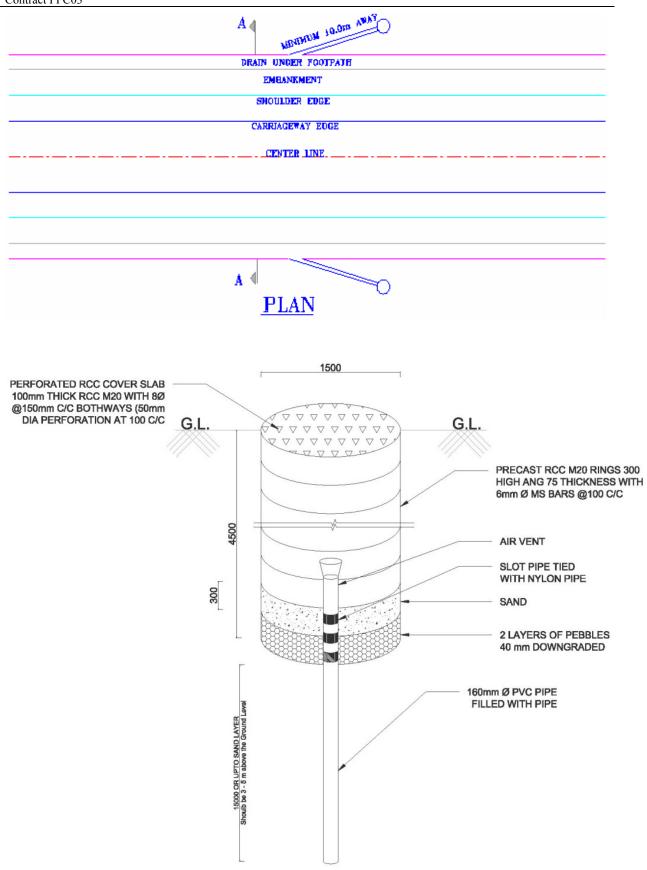

8.4.3. Runoff and Drainage Changes – Mitigation

- Continuous drain (lined/unlined) is provided throughout the project road for efficient drainage of storm water
- Lined drain is provided at builtup location for quick drainage of storm water
- The increased runoff due to increased impervious (bituminous top) surface will be countered by providing rainwater harvesting pits along the roads, at 500 m interval alternatively on both sides, connected to the drains through PVC pipes. The pits should be at least 3 5 m above the highest ground water table. The schematic diagram of rainwater harvesting pit is presented below. These structures shall be provided only in rural areas due to land constrain at built up areas as well as to ensure safety of pedestrians.
- The local bodies need to discourage / stop the filling of private water bodies, ponds etc. to develop commercial places and shops due to the improved roads and improved connectivity.

Table 8.5.Locations of Drains in Rural Area

8.4.4. Water Requirement for Project – Mitigation

Acquisition and management of water for construction is an issue that must be addressed by the contractor. The Contractor is expected to obtain water for construction purposes that is of a high water quality.

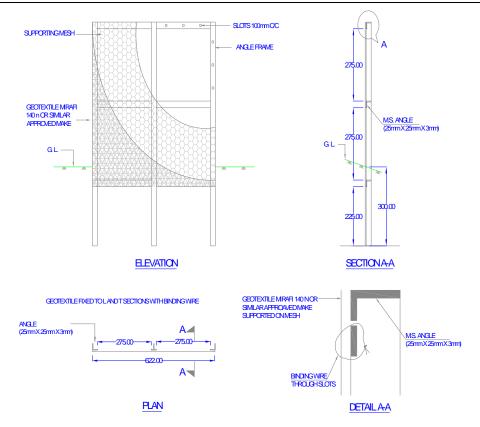

- Contractor needs to obtain approvals for taking adequate quantities of water from surface and ground water sources. This is required to avoid depletion of water resources.
- Contractor is required to minimise wastage of water.
- Water conservation methods to be adopted during construction process to make optimum use of water, as limited water sources are available along the project roads.

8.4.5. Water Pollution - Mitigation

8.4.5.1. Surface Water Quality

Construction Phase

- Suitable silt screen and sedimentation traps should be provided to the drains, to minimise the turbidity and silting in natural drainage.
- Piling activity for bridge construction shall be carried out during non-monsoon season.
- Washing of construction equipment, machineries and vehicles used for transporting materials should be strictly prohibited in rivers, nalas and other water bodies.
- The worker's camp must not be located within 1km from the dense builtup areas and water reserves.
- Runoff from the construction camps including workshops and vehicle garages should be passed through catch drain followed by oil interceptors (Section 8.3.5).
- Adequate sanitary facilities, drainage, washing and toilet facilities with septic tanks and refuse collection and disposal systems should be provided to the workers. The provision of water supply and toilet facilities should be made as per the stipulated guidelines in the Indian Labour Act.
- Construction debris and domestic waste should be collected, stored, transported and disposed safely to the approved land fill site identified for the project.
- Awareness program for workers and proper training to the personal handling oil, paints and lubricants and vehicle repairing employees, to respond immediately to spillages of hazardous materials shall be provided by contractors.
- Guidelines presented in IRC: SP -42-1994 "Guidelines for Road Drainage" and IRC: 36 1974 "Recommended Practice for Treatment of Embankment Slopes for Erosion Control" should be followed for construction of drainages and embankments for the proposed project.
- Water quality monitoring shall be conducted as per Environmental Monitoring Plan so that appropriate measures are taken up towards abatement of pollution.

Drawing No. 8.5: Concept Plan of Silt Fencing

Operation Phase

• Appropriate drainage arrangements with catch drains and catch pits designed to safely drain out the hazardous chemicals should be provided.

8.4.5.2. Ground Water Quality

Construction Phase

- The construction camp must not be located within 1km from the dense builtup areas and water reserves.
- Runoff from the construction camps including workshops and vehicle garages should be passed through catch drain followed by oil interceptors (Section 8.3.5) finally utilized for dust suppression at construction camp.
- Water quality monitoring should be conducted as per Environmental Monitoring Plan so that appropriate measures are taken up towards abatement of pollution.

8.4.6. Water Quality Monitoring

Apart from provision of the mitigation measures, their effectiveness and further improvement in designs to reduce the concentration of pollutants in the soil due to construction activity shall be monitored, as contamination of soil is directly linked with contamination of water. The monitoring plan shall be functional in construction as well as in operation stages. Water Quality Monitoring shall be conducte das per the monitoring plan in EMP.

8.5. Noise Environment – Mitigation Measures

Environmental noise particularly highway traffic noise, is a complex phenomenon because its intensity and characteristics vary with time depending upon the frequency as well as type of vehicles. Suggested mitigation measures for the impacts identified in **Section 7.6.** are listed below.

Sr. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
1	Sensitive receptors	Direct impact	Increase in noise pollution	Noise barrier to be provided Traffic calming devises to be used. NO Horn Zone sign Post.
2a	Noise Pollution (Pre- Construction Stage)	Direct impact, short duration	Man, material & machinery movements Establishment of labor camps onsite offices, stock yards and construction plants	Area specific and for short duration Machinery to be checked & complied with noise pollution regulations. Camps to be setup away from the settlements, in the down wind direction.
2b	Noise Pollution (Construction Stage)	Marginal Impact	stone crushing, asphalt production plant and batching plants, diesel generators etc Community residing near to the work zones	Camps to be setup away from the settlements, in the down wind direction. Noise pollution regulation to be monitored and enforced. Temporary as the work zones will be changing with completion of construction
2c	Noise Pollution (Operation Stage)	Marginal Impact	due to increase in traffic (due to improved facility)	will be compensated with the uninterrupted movement of heavy and light vehicles till the facility reaches the level of service C.
3	Noise Pollution Monitoring		Effectiveness / shortfall (if any) Any unforeseen impact	Measures will be revised & improved to mitigate/ enhance environment due to any unforeseen impact.

8.5.1. Impacts on Sensitive Receptors – Mitigation

All schools, hospitals and cultural properties have been identified and those that are close to the project roads will require noise barrier (2 m concrete wall and plantation of mast trees (*Polyalthia longifolia*) at 1.5m interval behind the wall) to accommodate the long-term impact of the improved road. Use of horns should be restricted at sensitive locations like schools and hospitals through the use of appropriate signboards along the road. Use of air horns should be minimized during night.

Table 8.7. List of Sensitive Noise Receptors and Mitigation Measures

Sl.	Chainage	Name of Sensitive receptor	Location	Distance	Dimensi	ons	Impact	Mitigation/Enhancement

Drawing No. 8.6: Conceptual Drawing for Noise Barrier

8.5.2. Noise Pollution – Mitigation

Construction Phase

- Careful planning of machinery selection, operations and scheduling of operations can reduce noise levels.
- Construction contract should clearly specify the use of equipment emitting noise of not greater than 90 dB(A) for the eight hour operation shift.

- The citing of construction yards should be done leaving at least 100 m distance from any residential areas, which will allow noise to attenuate.
- The main noise producing sources such as the concrete mixers, generators, grader etc. should be provided with noise shields around them. The noise shields can be any physical barriers, which is effective in adequate attenuation of noise levels. A 3 m high enclosure made up of brick and mud with internal plastering of a non-reflecting surface will be very effective in this regard.
- For protection of construction workers, earplugs should be provided to those working very close to the noise generating machinery.
- To avoid significant impacts on human health, it is being recommended to avoid construction work at certain sections during night times and ensure that only minimum required machinery is deployed on the site. At construction sites within 150 m of human settlements, noisy construction should be stopped between 10:00 pm and 8:00 am
- Noise level monitoring should be conducted as per Environmental Monitoring Plan given in EMP.

Operation Phase

- The proposed avenue plantation and other noise mitigation measures are expected to minimize the impacts on the immediate influence area of the project road.
- Development of greenbelt comprising selected species of trees with high canopy along the project road for attenuation of noise.
- Noise monitoring should be conducted as per Environmental Monitoring Plan.

8.5.3. Noise Pollution Monitoring

Apart from provision of the mitigation measures, their effectiveness and further improvement in designs to reduce the concentration of pollutants in the soil due to construction activity shall be monitored, as contamination of soil is directly linked with contamination of water. The monitoring plan shall be functional in construction as well as in operation stages. Noise monitoring should be conducted as per the environmental monitoring plan given in the EMP.

8.6. Flora and Fauna – Mitigation Measures

The major impact in this project on flora involves the removal of trees to permit construction and to provide clear zone for safety of the road users. There is no recorded wild life habitat in near vicinity of the project corridor.

Trees located within the formation width need to be removed to prevent collision with the trees, in case of accident. Roadside trees with strong and rigid stems can pose safety hazards. Some trees obstruct clear sight distances. Others have a propensity to overturn when old and are potential safety hazards depending upon age and decay condition. All such trees that are safety hazards need to be cleared. Mitigation measures for impacts identified are presented below.

Table 8.8.Impact on Flora and Fauna and Mitigation Measures

Sr. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
1	Forest area	No Direct Impact	No forest land to be diverted	Precautions to be taken during construction near forerst areas such as avoiding blasting, locating construction camps away from forests, avoiding work during night time and providing training to workers. Proper signages and rumble srips will be provided to avoid the accidents.
2	Wild Life	No Impact	No wild life habitat	Nil
3	Trees Cutting	Direct impact	Increase in soil erosion, silting of water bodies, Dust & noise pollution. loss of shade & loss of tree products	Maximum deviation in alignment design to save the road side trees. Compulsory tree plantation in the ratio of 1:10, i.e. for each tree cut, ten saplings will be planted. Avenue plantation along corridor. Small tres and endangered tree species will be transplanted.
4	Vegetation	Direct Impact	Increase in soil erosion, silting of water bodies, noise pollution. Dust Pollution	Clearing and grubbing will be minimized, and sprinkled with water to reduce dust pollution. Exposed surface like embankment slopes will be protected with stone pitching and turfing. Open land in and around plant will be vegetated.
5	Cattle Grazing	No Impact	No cattle grazing found	Nil

8.6.1. Impacts on Forest Area – Mitigation

Construction Phase

- Blasting and mechanical drilling of rocks should not be adopted for cutting of rock masses. Instead of blasting, rock cutting shall be adopted to avoid the nuisances to the wildlife present in the forest areas of the project road.
- Construction camp should not be set up near the forest areas. Only minimum required machinery shall be deployed on the site.
- Lighting for construction site at forest locations should be avoided during night time.
- Adequate awareness program should be provided to the construction workers on forest and environment.

8.6.2. Impacts on Wildlife – Mitigation

No wildlife habitat/wildlife crossing seen along the project corridor.

8.6.3. Tree Cutting – Mitigation

The mitigation and enhancement measures taken along the project corridors includes,

- Compensatory tree plantation at the ratio of 1:10
- Transplantation of small trees (<30 cm girth size)
- Plantation at Governemnt institutional premises

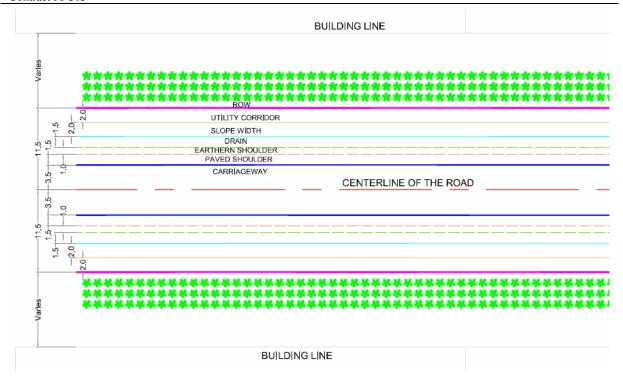

8.6.3.1. Avenue Plantation

Avenue plantation shall be carried out as per IRC SP 21 - 2009 "Guidelines on Landscaping and Tree Plantation". Trees shall be planted along the project corridors by TNRSP through Tamil Nadu Forest Department. Such plantations will be initiated once the construction is complete. The objective behind such plantation is to cover / re-vegetate the areas within the RoW that are presently barren. To maintain the present character of strip plantation, similar indigenous trees should be planted. Small trees (<30 cm) shall be transplanted wherever possible to minimize the impacts of loss of trees. List of indigenous tree species recommended in "Annex E (clause 11.11.1)" in IRC SP 21 -2009 for plantation for Tamil Nadu State is presented as **Table 8.9**.

Sl No.	Botanical Name	Common Name		
1	Albizzia procera	Safed Siris		
2	Albizzia amara	Cylone Siris		
3	Amhertia nobilis	Tree of Heaven / Pride of Burma		
4	Bischofia javanica	Paniala / Pankain		
5	Colvelia recemosa	Kilbili		
6	Dalbergia latifolia	Black shisham / Rosewood		
7	Delonix regia	Gulmohar		
8	Mengifera indica	Desi mango		
9	Michelia champaka	Swarnachampa		
10	Peltophorum pherugenium	Fellow Gulmohar		
11	Polyalthia longifolia	Ashok		
12	Arecaceae	Palm trees		
13	Saraca asoca	Sita Ashok		
14	Santalum album	White sandal		
15	Tamrindus Indica	Imli		

 Table 8.9.
 List of Indigenous Trees Spices Suggested for Avenue Plantation

As per the Madras High Court order, 10 trees are to be planted for each tree to be cut. All plantation work shall take place at the onset of monsoon season. The plant should be provided with adequate protection from animals and proper monitoring should be carried out to ensure their growth and survival rate. Costing has been done as per forest schedule of rate, including the plantation and maintenance cost for 5 years. Summary of tree to be transplanted (less than 300 mm) is given in **Table 8.10**.

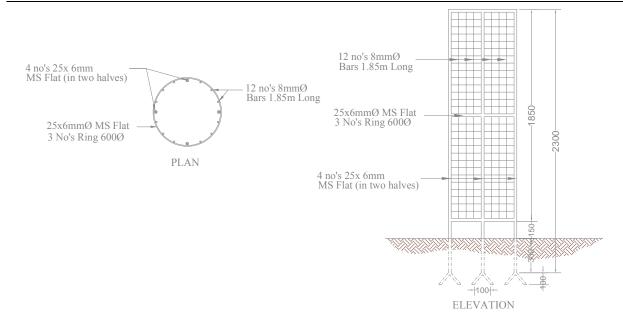

Drawing No. 8.7: Conceptual Plan for Avenue Plantation

Table 8.10. Sum	mary of Trees to	be Transplanted
-----------------	------------------	-----------------

Sl	Name of the Corridor	No. of Trees to be transplanted						Grand
No		With Manpower		Using Machinery (100-300mm)			Total	
		LHS	(<100mm)		LHS RHS		Total	
1	Tiruchengode to Paramathy Section of Road No. 2 (SH 86)	454	257	711	116	107	223	934
2	Malliyakarai to Rasipuram Section of Road No. 4 (SH 79)	13	7	20	46	68	114	134
3	Rasipuram to Tiruchengode Section of Road No. 4 (SH 79)	158	109	267	128	146	274	541
4	Mohanur to Namakkal Section of Road No. 5 (SH 95)	72	45	117	83	92	175	292

8.6.3.2. Plantation at Enhancement Sites

A number of Government Offices, schools, hospitals, and cultural properties exist along the project corridors. Tree such as *Polyalthia longifolia* (Mast tree) is proposed for planting sensitive receptor's premises, so that impact of noise pollution due to traffic can be reduced. Landscape design has been worked out to enhance the aesthetic beauty of selected cultural property premises. Drawings for Plantation at enhancement sites are shown in **Annexures 3.56 & 3.59** of EMP Report.

Drawing No. 8.8: Conceptual Plan for Tree Guard

8.6.4. Impacts on Vegetation – Mitigation

High embankment will be re-vegetated with local shrubs and grasses to prevent soil erosion form the bare earth, prior to the monsoon.

8.6.5. Cattle Grazing – Mitigation

No cattle grazing are seen along the corridor.

8.7. Socio-Economic Environment – Mitigation

Adverse socio-economic impacts include all disruptions on the social and economic interactions of communities due to the road project. This involves effect on both the adjacent communities (mostly direct) as well as the nearby communities (mostly indirect). The various impacts have been detailed as:

- General impacts that apply to the entire corridor,
- Specific impacts on likely properties and PAPs, within the Corridor of Impact (CoI) of the project corridor.

8.7.1. General Impacts – Mitigation

General impacts to socio-economic environment due to project are summarized in Table 8.11.

Sl. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
1	Fear of uncertainties	Direct, long Impact	Land and property owners are subjected to sufferings	Public participation sessions were/will be conducted in

 Table 8.11.
 General Impacts to Socio-Economic Environment

Sl.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
No.	regarding future		regarding uncertainties of the extent of loss and the nature of compensation	different stages of project.
2	Inducement of land prices	Direst impact	Danger of unscrupulous speculators moving in to purchase land	Market Value Assessment Committee will decide the actual cost of land
3	Inducement of squatter influx	Direct impact	Squatters may attempt to occupy adjacent land in the hope of receiving compensation Undue pressure on local resources	The dates of base-line socio- economic survey have been considered as cut-off date for identification of project affected people PAP.
4	Loss of utilities and amenities	Direct Impact	Natural (trees, bushes and grasslands), and Physical structures (public or private assets and utilities).	Relocation of utilities will be completed prior to start of project work. These have been further discussed in details in RAP
5a	Public Health and Safety	High direct adverse impact	Psychological impacts on their owners and others associated with them. Debris generated	Advance notice as per RAP (4 months before commencement of work) will be given to the owners of the affected properties. Debris, so generated will be disposed to the satisfaction of Engineer. Refer Annexure 3.5 of the EMP Report
5b	Labour Camps	Direct Impact	Can have clashes with the local population Pressure on basic facilities like medical services, power, water supply, etc. Transmission of communicable diseases including aids. Sanitary conditions in the labour camps	All contractors will be encouraged to recruit the local people as labourer at least for unskilled and semi- skilled jobs. Hygiene and basic facilities will be ensured at labour camp to prevent the spread of disease. Refer Annexure 3.2 and 3.9 of the EMP Report
5c	Allied activities	Indirect Impact	Social and economic life of the local population due to quarrying and crushing operations, traffic diversions, etc. Traffic jams and congestion, loss of access and other road accident risks Temporary land acquisition	Detailed traffic control plans shall be prepared and submitted to the engineer for approval 5 days prior to commencement of work on any section of road.
5d	Accidents and Safety	Direct Impact	School children Local commuters	The contractor will provide, erect and maintain barricades, including signs marking flags lights and flagmen as required by the Engineer.

Sl. No.	Item	Impact	Impact (Reason)	Mitigation/Enhancement
6	Resettlement of People	In direct impact	Pressure on civil amenities, water sources, grazing lands, fuel wood, medical facilities etc.	A comprehensive resettlement action plan has been prepared to improve the standard of living of the affected population
7	Land Use Changes	Indirect impact	Succession of land uses and higher return uses would displace the lower return uses at major intersections and in settlement areas. Urban fringe areas will be subjected to ribbon development.	Project is widening of existing of pavement, hence no major change in land use pattern is envisaged along the project road.
8	Disturbance to road side services	Indirect Impact	Some Shops may be shifted, no income from highway users hence loss of service to the local people	The cleaning of such informal establishment will be carried out as phase-wise resettlement Programme
9	Removal of encroachments and squatters	Indirect impact	loss of shelter disturbance to family and community life	Impact will be avoided by implementation of phase- wise resettlement action programme. Notice will be served 4 months in advance.
10	Sensitive community facilities	Indirect impact	Loss of community facilities or institutions	Discussed in detail in following paragraphs.
11	Host Community	Indirect Impact	Displaced, resettled families will put pressure on the existing scarce infrastructure and amenities available with the host community	special provision has been made in the comprehensive resettlement action plan for the host community

8.7.1.1. Fear of Uncertainties Regarding Future

The Project is only of strengthening of the existing road, and within the confines of the existing RoW, the fear of uncertainties is most likely limited to the people squatting and encroaching in the RoW. At places where the community utilities are to be affected a certain amount of anxiety will be among the people in that particular community.

To remove such fear from the people, public participation sessions were/will be conducted in different stages of project, viz. pre-design, design, pre-construction and construction.

In the pre-design stage, a comprehensive socio-economic survey was conducted to prepare base line status of the households squatting or encroached upon the RoW. During the survey each households were contacted/interviewed and they were explained about the purpose of the survey, need of the project and benefits associated with the project etc.

The second stage of public participation was in the form of village meetings, focus group discussion, individual interviews, voluntary and academic institution consultation.

The third stage of participation session will start before pre-construction. The EMU will verify and consult the individual Eps with the help of an NGO for distribution of ID card. At this stage the Eps will be explained about their entitlement and R&R framework.

All people likely to be displaced will be informed in advance through NGO by a time bound programme about resettlement to remove fear of uncertainty.

During the construction stage the consultation process will continue to avoid any inconvenience to the community at any point of time.

8.7.1.2. Inducement of Land Prices

As the project becomes common knowledge, the land prices along the corridor will increase. For realignment and geometric improvement of highway, extra additional land may be required; Market Value Assessment Committee will decide the actual cost of such land. The actual cost of land may be different from induced land cost. The MVAC have time bound programme to calculate the actual cost of land. In calculating the actual land, cost individual project affected person (PAP) & NGOs will be involved.

8.7.1.3. Inducement of Squatter Influx

Once the project becomes common knowledge, people may attempt to occupy the land along the corridor in anticipation of compensation. To avoid such, the dates of base-line socio-economic survey have been considered as cutoff date for identification of project-affected people, who are eligible for compensation. The cut off dates will be used to establish whether a person located in the right way qualifies as a PAP for the disbursement of compensation. All the PAPs recorded during socio-economic baseline survey are eligible for compensation after verification by EMU.

8.7.1.4. Loss of Utilities and Amenities

The site clearance for construction of road may result in loss or relocation of certain utilities and amenities, viz. electricity, water and telephone line etc. People dependent upon these utilities and amenities may experience inconvenience and economic loss. However, such impacts are unavoidable, but every care will be taken in co-ordination with concerned departments, to restore the facility within shortest possible time to avoid any prolonged hardship or inconvenience to the community. Similarly, other utilities like water source, cattle trough etc. will be constructed or replaced at appropriate place with the consent of community prior to dismantling the existing one.

8.7.1.5. Public Health and Safety

- a) During the Pre-construction and Construction Phases dismantling of the structures for CoI clearance and road construction may result in health hazards. To minimize this potential negative impact the following recommendations should be adopted:
 - To avoid the psychological impacts due to the demolition of properties on the owners and other tenants. The advance notice as per RAP will be given to the owners of the affected properties. An advance notice will be served at least four months before construction commences. For squatters needing relocation, all R&R activities will be undertaken and entitlements will be completed before construction starts.

• Debris generated from the demolition of properties will be properly disposed of to avoid the health problems in the safeties. Earth material, if required will be dumped in borrow areas as approved by the engineer. Borrow areas will be filled to avoid health hazards from stagnant water collecting in these areas. The contractor will make all arrangements for dismantling and cleaning up of debris. Implementation will be as per the approval and direction of the engineer.

b) During the construction period the potential negative community impacts arising from imported labour in the labour camps will be avoided as per following:-

All contractors will be encouraged to recruit the local people as labours at least for unskilled and semi-skilled jobs. This would automatically reduce the magnitude of impact expected due to outside labour. Wherever the local labours are not available, the contractor should ensure the following provision for imported labour.

- The additional stress on the facilities like medical services, power, water supply due to a labour camp in a local area will be avoided by the contractor providing these facilities for the labours as per the direction of the Engineer
- In areas where wildlife resources are abundant, construction workers shall be instructed how to protect natural resources, fauna, flora and aquatic life. In such areas hunting and unauthorized fishing are prohibited.
- In the labour comps, all temporary accommodation must be constructed and maintained in such a fashion that uncontaminated water is available for drinking, cooking and washing. The sewage system for the camp will be properly designed built and operated so that no health hazard occurs. Garbage bins will be provided in the camp and regularly emptied. The collected garbage will be disposed-off in a hygienic and approved manner.
- c) Allied activities during construction period may cause local disruption:

In the construction phase, there may be inconvenience to the local people as well as the highway passengers due to traffic jams and congestion, loss of access and other road accident risk as a result of construction. Detailed traffic control plans shall be prepared and submitted to the engineer for approval 5 days prior to commencement of work on any section of road. In the preparation of the traffic control plan special consideration shall be given to the safety of pedestrians and workers at night.

d) Accidents and Safety

To avoid the accidents during construction phase, contractor shall take all necessary measures to ensure traffic safety. The contractor will provide, erect and maintain barricades, including signs marking flags lights and flagmen as required by the Engineer.

In the operation phase, traffic control measures such as speed breakers and sign boards (including speed limits) will be provided and strictly enforced in residential areas, near schools and water bodies like ponds and wells.

8.7.1.6. Resettlement of People

People displaced from their home and livelihood on account of the proposed activity will be taken care in the project. A comprehensive resettlement action plan has been prepared to improve the

standard of living of the affected population if not at least restore their livelihood and regaining their former standard of living (Refer Resettlement Action Plan Report).

8.7.1.7. Land Use Changes

As regards land use changes, it is likely that the impact would be very minimal. Since the project is widening of road within the existing ROW, the possibility of major land acquisition is not envisaged. In design stage, utmost care has been taken to keep the land acquisition at minimal for road realignment and geometric purpose. The probable impact on roadside business and trees within RoW has been reduced and avoided through design.

8.7.1.8. Disturbance to Roadside Service

Along the highway, near settlements, small shops serve the local people as well as highway users. Some of these shops are within the RoW. To avoid any impact on livelihood of people dependent on roadside business, the cleaning of such informal establishment will be carried out as phase-wise resettlement programme. Loss of livelihood of the displaced shop owners will be compensated as per assistance or entitlements in Entitlement Framework of Tamil Nadu.

8.7.1.9. Removal of Encroachments and Squatters

The impact due to removal of encroachments and squatters will be avoided by implementation of phase-wise resettlement action programme. To avoid the severance of impact, advance notice will be given to the encroachers and squatters. The notice will be given four months prior to construction phase starts. Relocation of all such impacted persons will be as per R&R schedule.

8.7.1.10. Sensitive Community Facilities

The impacts due to project on the sensitive community facilities such as health facilities, a number of recreational facilities and others like ponds and cultural community assets and educations institutions are avoided in the design phase of the project. These are discussed in detail in **Section 8.7.2.1**.

8.7.1.11. Host Community

Families displaced due to the project will be resettled at suitable place. This may put pressure on the existing scarce infrastructure and amenities available with the host community. To avoid such pressure on already scarce resources, *viz.* water, grazing land, fuel woods, and medical facility etc. Special provision has been made in the comprehensive resettlement action plan for the host community. This will be applicable where the total number of resettled people exceeds 200 or 10 percent of the host community whichever is less (Refer: Resettlement Action Plan Report).

8.7.2. Specific Impacts – Mitigation

8.7.2.1. Sensitive Community Structures

A number of sensitive community assets exist within the Project Influence Area. **Table 8.12** presents the impacts and mitigation / enhancement proposed at each location.

Besides mitigation & enhancement, following measures will be taken for safety of the locals:

- Local people will be informed about the schedule of construction activity, so that the local people remain prepared in advance.
- The existing sign boards will not be removed but shifted to appropriate place during construction, so that people don't find problem in identifying the tourist/religious place.
- During construction proper demarcation and sign board, indicators and flag man will be deputed for safe traffic movement.

8.8. Bus Shelter, Bus Bays, Truck Lay Byes, Resting Place and Service Road

As a part of road improvement, bus shelters will be constructed/repaired at all built-up locations. Proposal for bus shelter, bus bays are summarized in **Section 2.8.5.** All the existing bus shelters will be either reconstructed/relocated or repaired or rehabilitated. The list of existing bus bays and busstops are presented in **Table 8.12**.

Drawing No. 8.9A: Conceptual Plan for Bus shelter

Drawing No. 8.9B: Conceptual Plan for Bus Laybye

8.9. Truck Lay bye, Resting Place and Service Road

No truck lay bye, resting places and service roads are proposed as part of the subject project.

8.10. Avoidance of Disruption and Safety Risks during the Construction Stage

8.10.1. Disruption to the Community

8.10.1.1. Loss of Access

At all times, the Contractor will provide safe and convenient passage for vehicles, pedestrians and livestock to and from side roads and property accesses connecting the project road. Work that affects the use of side roads and existing accesses will not be undertaken without providing adequate provisions.

The works will not interfere unnecessarily or improperly with the convenience of public or the access to, use and occupation of public or private roads, railways and any other access footpaths to or of properties whether public or private.

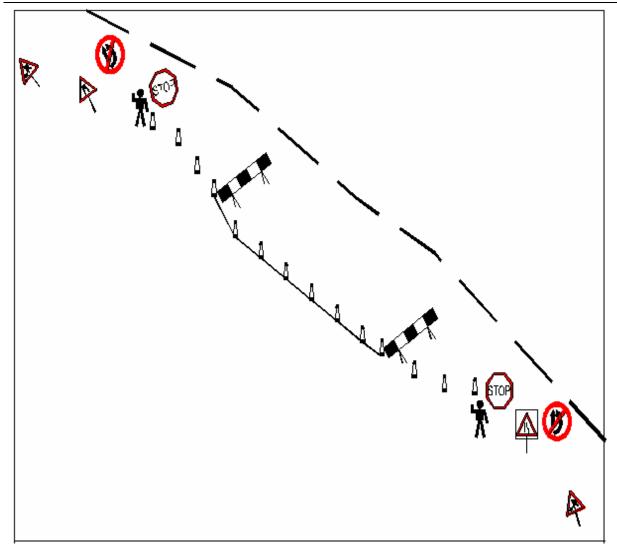

8.10.1.2. Traffic Jams, Congestion and Safety

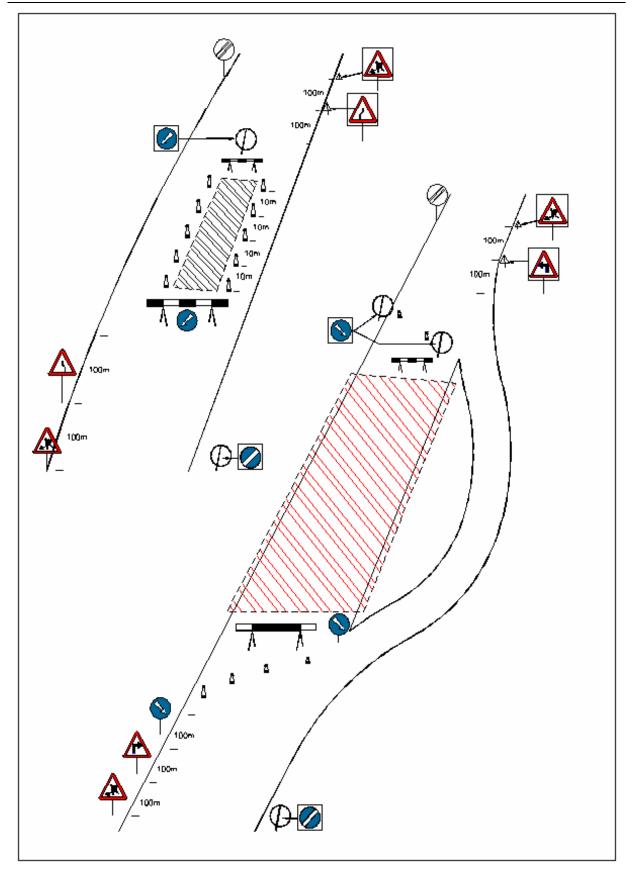

Detailed Traffic Control Plans will be prepared prior to commencement of works on any section of road. The traffic control plans will contain details of temporary diversions, details of arrangements for construction under traffic and details of traffic arrangement after cessation of work each day.

Temporary diversion (including scheme of temporary and acquisition) will be constructed with the approval of the Engineer and the EMU. Special consideration will be given in the preparation of the traffic control plan to the safety of pedestrians and workers at night.

The Contractor will ensure that the running surface is always properly maintained, particularly during the monsoon so that no disruption to the traffic flow occurs. The temporary traffic detours will be kept free of dust by frequent application of water, if necessary.

The Contractor will take all necessary measures for the safety of traffic during construction and provide, erect and maintain such barricades, including signs, markings, flags, lights and flagmen as may be required by the Engineer for the information and protection of traffic approaching or passing through the section of the highway under improvement.

Drawing No. 8.10: Conceptual Plan for traffic Diversion

8.10.2. Safety of the Workers

8.10.2.1. Risk from Operations

The Contractor is required to comply with all the precautions as required for the safety of the workmen as per the International Labour Organisation (ILO) Convention No. 62 as far as those are applicable to this contract. The contractor will supply all necessary safety appliances such as safety goggles, helmets, masks, etc., to the workers and staff. The contractor has to comply with all regulation regarding safe scaffolding, ladders, working platforms, gangway, stairwells, excavations, trenches and safe means of entry and egress.

8.10.2.2. Risk from Electrical Equipment

Adequate precautions will be taken to prevent danger from electrical equipment. No material or any of the sites will be so stacked or placed as to cause danger or inconvenience to any person or the public. All necessary fencing and lights will be provided to protect the public. All machines to be used in the construction will conform to the relevant Indian Standards (IS) codes, will be free from patent defect, will be kept in good working order, will be regularly inspected and properly maintained as per IS provisions and to the satisfaction of the Engineer.

8.10.2.3. Risk at Hazardous Activity

All workers employed on mixing asphaltic material, cement, lime mortars, concrete etc., will be provided with protective footwear and protective goggles. Workers, who are engaged in welding works would be provided with welder's protective eye-shields. Stone-breakers will be provided with protective goggles and clothing and will be seated at sufficiently safe intervals.

The use of any herbicide or other toxic chemical will be strictly in accordance with the manufacturer's instructions. The Engineer will be given at least 6 working days' notice of the proposed use of any herbicide or toxic chemical. A register of all herbicides and other toxic chemicals delivered to the site will be kept and maintained up to date by the Contractor. The register will include the trade name, physical properties and characteristics, chemical ingredients, health and safety hazard information, safe handling and storage procedures, and emergency and first aid procedures for the product.

8.10.2.4. Risk of Lead Pollution

No man below the age of 18 years and no woman will be employed on the work of painting with products containing lead in any form. No paint containing lead or lead products will be used except in the form of paste or readymade paint. Face masks will be supplied for use by the workers when paint is applied in the form of spray or a surface having lead paint dry rubbed and scrapped.

8.10.2.5. Risk Caused by Force' Majeure

All reasonable precaution will be taken to prevent danger of the workers and the public from fire, flood, drowning, etc. All necessary steps will be taken for prompt first aid treatment of all injuries likely to be sustained during the course of work.

8.10.2.6. Risk from Explosives

Except as may be provided in the contract or ordered or authorised by the Engineer, the Contractor will not use explosives. Where the use of explosives is so provided or ordered or authorised, the Contractor will comply with the requirements of the following Sub-Clauses of this Clause besides the law of the land as applicable.

- The Contractor will at all times take every possible precaution and will comply with appropriate laws and regulations relating to the importation, handling, transportation, storage and use of explosives and will, at all times when engaged in blasting operations, post sufficient warning flagmen, to the full satisfaction of the Engineer.
- The Contractor will at all times make full liaison with and inform well in advance and obtain such permission as is required from all Government Authorities, public bodies and private parties whatsoever concerned or affected or likely to be concerned or affected by blasting operations.

8.10.2.7. Malarial Risk

The Contractor will, at his own expense, conform to all anti-malarial instructions given to him by the Engineer, including filling up any borrow pits which may have been dug by him.

Gravid, blood-laden mosquitoes cannot fly very far, so they generally bite within a kilometer or so of their breeding place. Thus borrow pits and any other water bodies created during the construction process will be situated 1 to 2 Km away from the human settlements. Pits dug up closer than these will be adequately drained to prevent water logging.

Similarly, compensatory measures for filling up part of the water bodies situated adjacent to the project corridors will be directed towards deepening of the water bodies concerned. This way the capacity of the water body remains the same, while water surface available for breeding of mosquitoes is reduced. This will have an additional advantage of decreased evaporation losses, which will be important in water-scarce corridors.

8.10.2.8. First Aid

At every workplace, a readily available first aid unit including an adequate supply of sterilized dressing material and appliances will be provided as per the Factory Rules. Workplaces, which are remote and far away from regular hospitals, will have indoor heath units with one bed for every 250 workers. Suitable transport will be provided to facilitate take injured or ill person(s) to the nearest applicable hospital. At every workplace, an ambulance room containing the prescribed equipment and nursing staff will be provided as prescribed.

8.10.2.9. Potable Water

In every workplace at suitable and easily accessible places a sufficient supply of cold potable water (as per IS) will be provided and maintained. If the drinking water is obtained from an intermittent public water supply then, storage tanks will be provided. All water supply storage will be at a distance of not less than 15m from any latrine, drain or other source of pollution. Where water has to be drawn from an existing well, which is within such proximity of any latrine, drain or any other source of pollution, the well will be properly chlorinated before water is drawn from it for drinking water. All such wells will be entirely closed in and be provided with a trap door, which will be dust proof and

waterproof. A reliable pump will be fitted to each covered well. The trap door will be kept locked and opened only for cleaning or inspection, which will be done at least once a month.

8.10.2.10. Hygiene

The Contractor during the progress of work will provide, erect and maintain necessary (temporary) living accommodation and ancillary facilities for labour to standards and scales approved by the resident engineer.

There will be provided within the precincts of every workplace, latrines and urinals in an accessible place, and the accommodation, separately for each for these, as per standards set by the Building and other Construction Workers (regulation of Employment and Conditions of Service) Act, 1996. Except in workplaces provided with water-flushed latrines connected with a water borne sewage system, all latrines will be provided with dry-earth system (receptacles) which will be cleaned at least four times daily and at least twice during working hours and kept in a strict sanitary condition. Receptacles will be tarred inside and outside at least once a year. If women are employed, separate latrines and urinals, screened from those for men and marked in the vernacular will be provided. There will be adequate supply of water, close to latrines and urinals.

All temporary accommodation must be constructed and maintained in such a fashion that uncontaminated water is available for drinking, cooking and washing. The sewage system for the camp must be properly designed, built and operated so that no health hazard occurs and no pollution to the air, ground or adjacent watercourses takes place. Compliance with the relevant legislation must be strictly adhered to. Garbage bins must be provided in the camp and regularly emptied and the garbage disposed-off in a hygienic manner. Construction camps are to be sited away from vulnerable people and adequate health care is to be provided for the work force.

Unless the arrangement made by the local sanitary authority, arrangement for proper disposal of excreta by incineration at the workplace will be made by means of a suitable incinerator approved by the local medical health or municipal authorities. Alternatively, excreta may be disposed-off by putting a layer of night soils at the bottom of a permanent tank prepared for the purpose and covering it with 15 cm layer of waste or refuse and then covering it with a layer of earth for a fortnight (by then it will turn into manure).

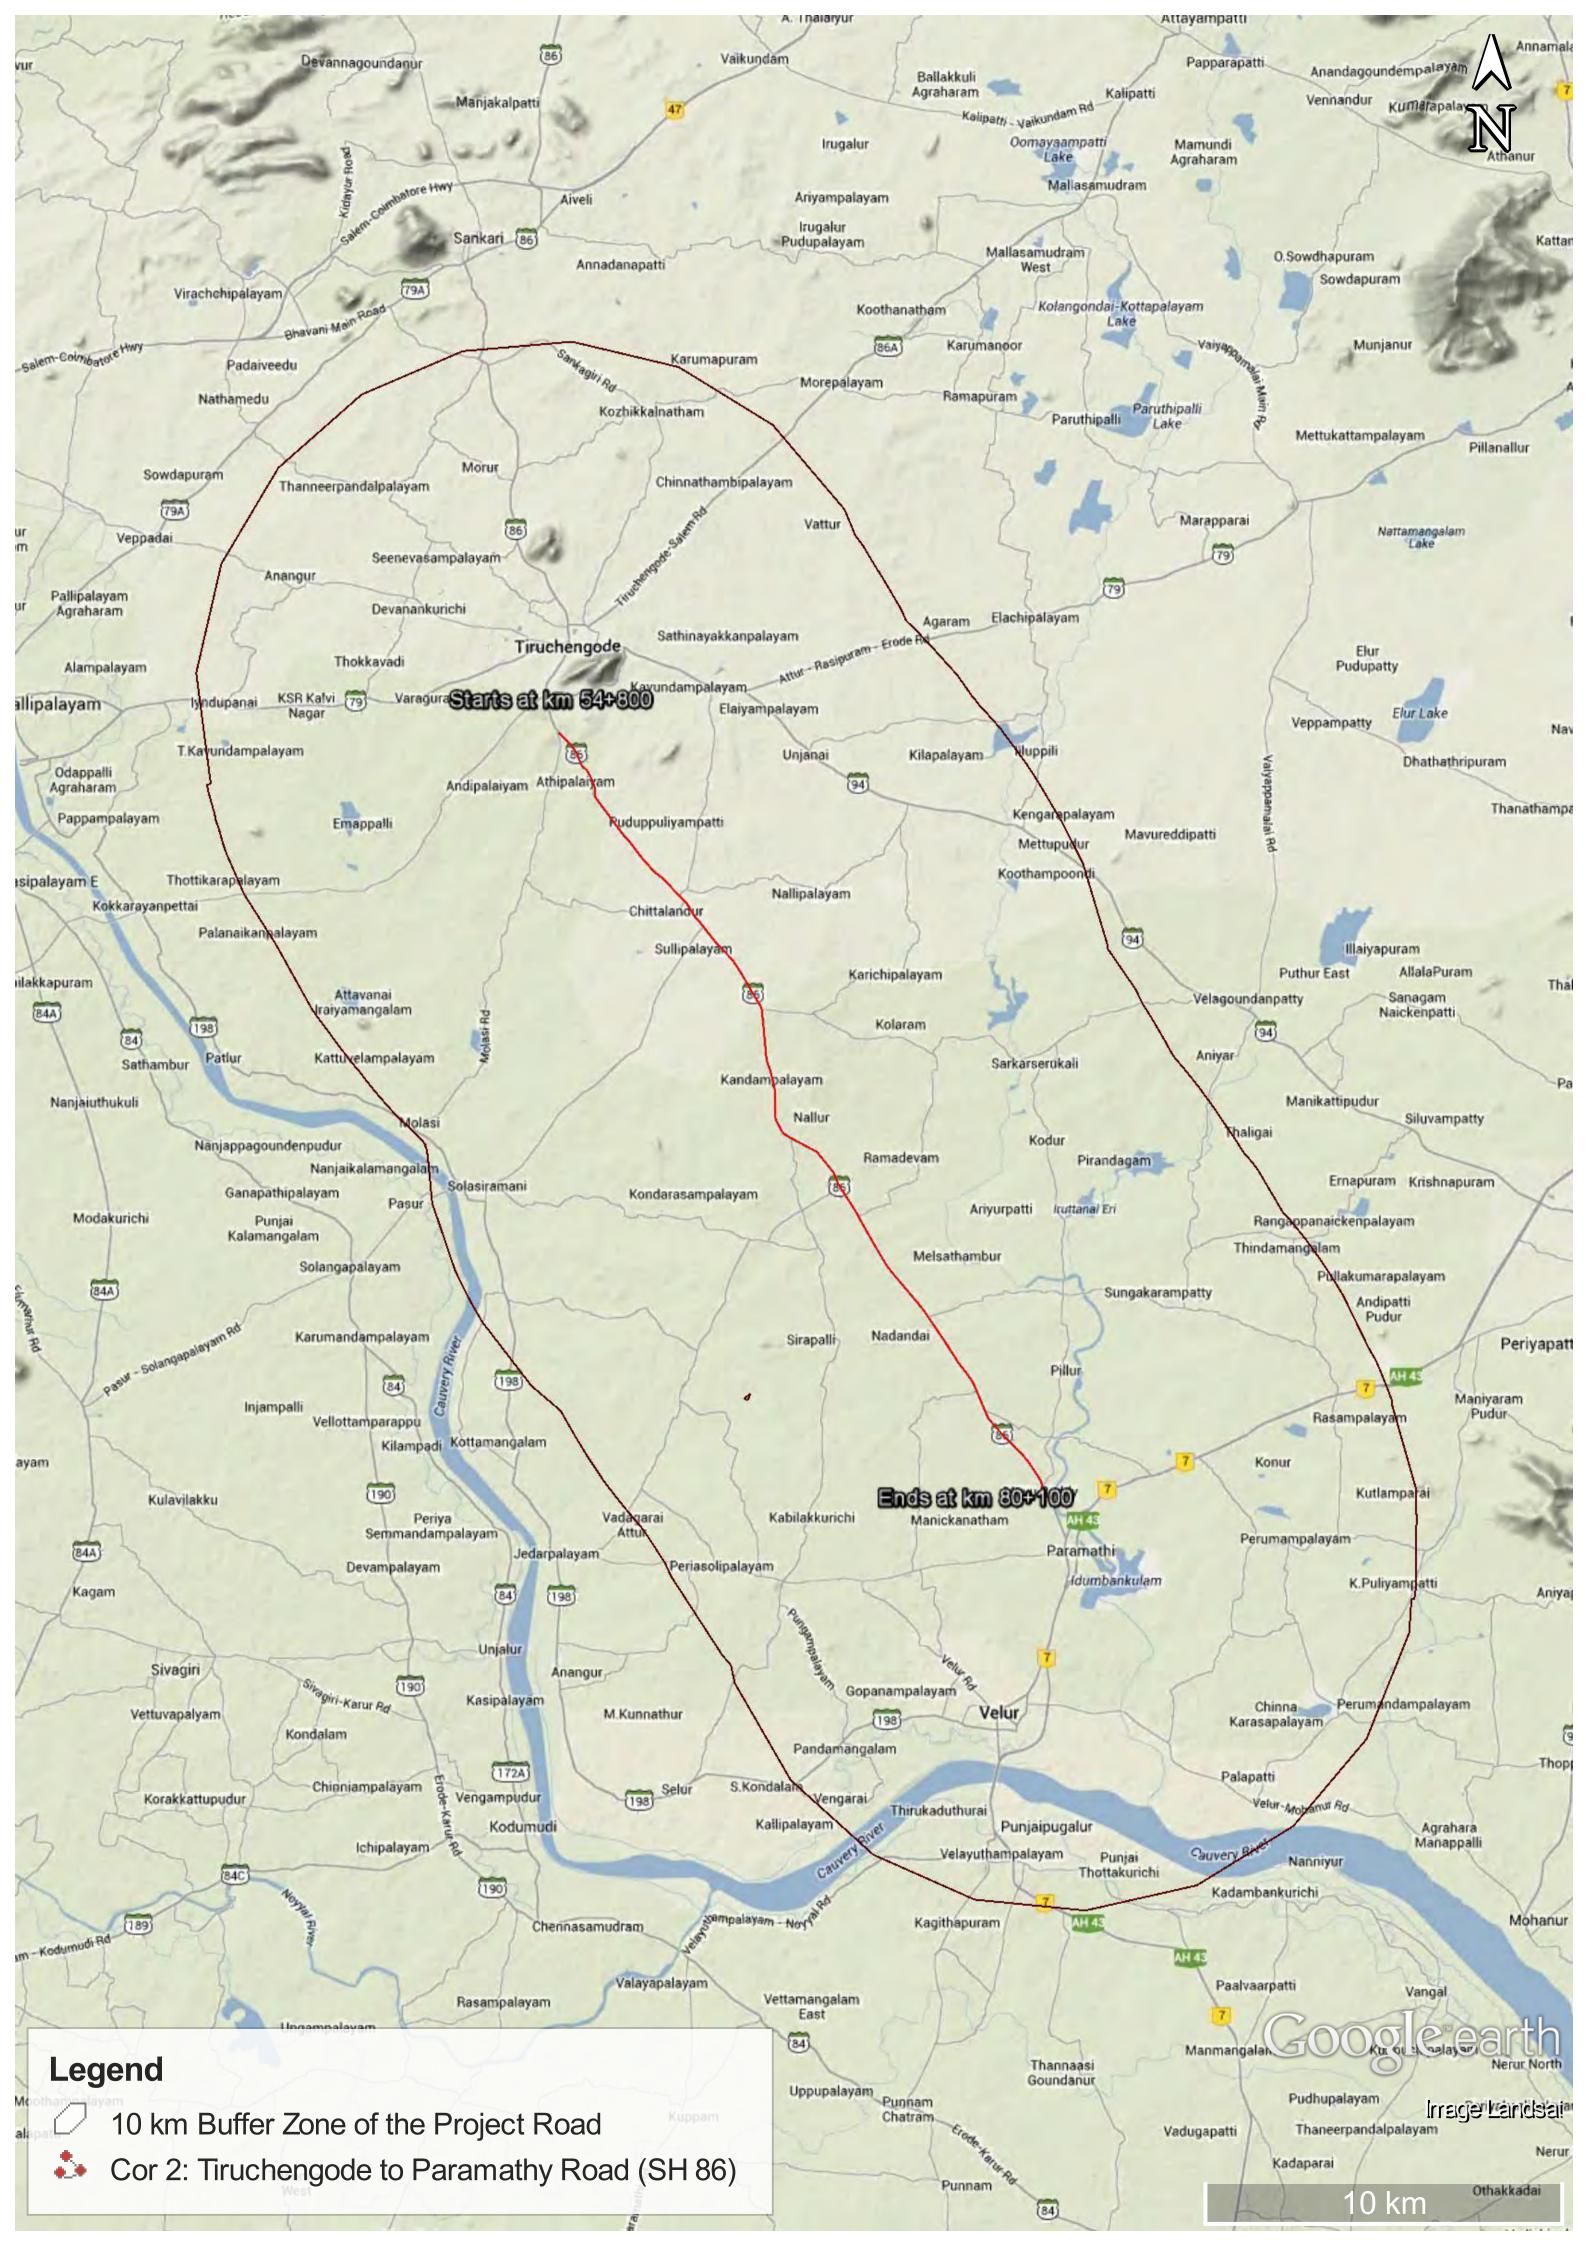

On completion of the works, the whole of such temporary structures will be cleared away, all rubbish burnt, excreta or other disposal pits or trenches filled in and effectively sealed off and the whole of the site left clean and tidy, at the Contractor's expense, to the entire satisfaction of the Engineer.

IUCN Categorization of Fauna Observed in the Forests along the Project Roads and Impact Areas

Name of the Species	IUCN Category
I PHYLUM : ARTHROPODA	
A. CLASS : MYRIOPODA	
1. Centipede scolopendra	This taxon has not yet been assessed for the IUCN Red List.
2. Millipede spirostreptus	This taxon has not yet been assessed for the IUCN Red List.
B. CLASS : INSECTA	
3. Periplanata americana (Cockroach)	This taxon has not yet been assessed for the IUCN Red List.
4. Glossina domestricca (Fly)	This taxon has not yet been assessed for the IUCN Red List.
5. Musca domestica (House Fly) Makki	This taxon has not yet been assessed for the IUCN Red List.
6. Anabillus sp. (Mosquito)	This taxon has not yet been assessed for the IUCN Red List.
C. CLASS : ARACHINDA	
1. Palamaeus swammerdami (Scorpion)	This taxon has not yet been assessed for the

Name of the Species	IUCN Category
	IUCN Red List.
VERTEBRATE	
III PHYLUM CHORDATA	
I. AMPHIBIA	
1. Euphlyctis hexadactylus (Indian Green Frog)	Least Concern
2. Rana tigrina (Indian bullfrog)	Least Concern
3. Duttaphrynus melanostictus (Black-spectacled	Least Concern
Toad)	
4. Cacopus sp.	This taxon has not yet been assessed for the IUCN Red List
II. REPTILIA	
5. Sitana ponticeriana (Fan Throated Lizard)	Least Concern
6. Chameleon sp. (Green Lizard)	This taxon has not yet been assessed for the IUCN Red List
7. Calotes verticolour (Garden Lizard)	This taxon has not yet been assessed for the IUCN Red List
8. Testudo elegans (Tortoise)	Lower Risk/least concern
Sub Class : SNAKES	
9. Ophiophagus hannah (King Cobra)	Vulnerable
10. Vipera aspis (Asp Viper)	Least Concern
11. Dryophis sp. (Eye Plucker)	This taxon has not yet been assessed for the IUCN Red List
12. Bangarus sp. (Krait)	This taxon has not yet been assessed for the IUCN Red List
13. Echis carinata (Little Indian viper)	This taxon has not yet been assessed for the IUCN Red List
III. BIRDS	
1. Eudynamys scolopaceus (Common Koel)	Least Concern
2. Sarkidiornis melanotos (Comb Duck)	Least Concern
3. Milvus migrans (Black Kite)	Least Concern
4. Alcedo meninting (Blue-eared Kingfisher)	Least Concern
5. Passer domesticus (House Sparrow)	Least Concern
6. Corvus splendens (House Crow)	Least Concern
7. Psittaciformes sp. (Parrot)	Least Concern
8. Pavo cristatus (Indian Peafowl)	Least Concern
IV. MAMMALIA	
1. Suncus murinus (House Shrew)	Least Concern
2. Pteropus giganteus (Indian Flying Fox)	Least Concern
3. Macaca radiata (Bonnet Macaque)	Least Concern
4. Funambulus palmarum (Common Palm Squirrel)	Least Concern
5 Sus scrofa (Wild Boar)	Least Concern
6. Melursus ursinus (Sloth Bear)	Vulnerable
7. Lepus nigricollis (Indian Hare)	Least Concern
8. Canis aureus (Jackal)	Least Concern

		Biological	Cutting of trees / collection of fire wood and non-timber forest produce (NTFP) from forest, hunting of wild animals, occurrence of forest fire.	Minor	-ve, T
		Socio- economic	Impact on Public health and law and order	Medium	-ve, T

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
		Solid waste management	No Impact	-	-
B.5.	Identification of site for	Land	Loss of productive land, destabilization of slopes due to modification of natural conditions	Major	-ve, P
	quarrying and stone	Water	Surface water pollution due to run off from the site	Minor	-ve, T
	crushing	Air	Increased air pollution due to fugitive dust	Medium	-ve, T
	operations	Noise	Increase in noise levels	Medium	-ve, T
		Biological	Loss of trees, Impact on forests and wildlife habitats	Minor	-ve, T
		Socio- economic	Risk for local inhabitants and passengers through nearby roads, railways, ropeways and waterways.	Medium	-ve, T
			Inconvenience to local traffic in access roads to quarry and crusher		
		Solid waste management	Impacts due to improper disposal of overburden from quarry site.	Minor	-ve, T
B.6.	Identification of borrow	Land	Loss of productive land, loss of top soil, soil erosion, alterations in local topography, flooding of land due to collapse of river bund / irrigation tank bund.	Major	-ve, P
	sites	Water	Collapse of irrigation tank bund and loss of irrigation water.	Minor	-ve, T
		Air	Increased air pollution due to fugitive dust	Minor	-ve, T
		Noise	Increase in noise levels	Minor	-ve, T
		Biological	Loss of trees, Impact on forests and wildlife habitats	Minor	-ve / T
		Socio- economic	Inconvenience to local traffic in access roads to borrow area, Occurrence of water borne diseases due to accumulation of water in borrowed lands.	Medium	-ve / T

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
		Solid waste management	No impact	-	-
B.7.	Identification	Land	No impact	-	-
	of water sources	Water	Ground water depletion	Major	-ve, P
	sources	Air	No impact	_	-
		Noise	No impact	-	-
		Biological	No impact	_	-
		Socio- economic	Reduction in water available for agriculture and domestic purposes	Major	-ve, P
		Solid Waste Management	No impact	-	-
B.8.	Identification	Land	Loss of soil productivity, soil contamination, soil erosion	Medium	-ve, P
	of site for debris /	Water	Surface water pollution due to run off from the debris and soil	Minor	-ve, T
	excess soil	Air	Air pollution due to fugitive dust during dumping of debris and soil	Medium	-ve, T
	disposal	Noise	Noise pollution due to movement of vehicles and dumping of debris.	Minor	-ve, T
		Biological	Loss of vegetative cover, impact on wildlife habitats	Medium	-ve, P
		Socio- economic	Obstruction to movement of local inhabitants, affect the safety and aesthetical beauty of the locality.	Minor	-ve, P
		Solid waste management	No impact	-	-
C.	Construction				
C.1.	Site Preparati				_
C.1.1.	Setting up of	Land	Soil contamination due to spillage of fuel and lubricants, soil erosion due to	Medium	-ve, P

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
	construction		surface run off.		
	camp	Water	Contamination of water due to spillage of oil and lubricants and surface runoff with sediments from construction camps.	Medium	-ve, T
			Contamination of water due to sewage from construction camps		
		Air	Air pollution due to fugitive dust and gaseous emissions from hot mix plant and diesel generator	Medium	-ve, T
		Noise	Increase in noise level due to diesel generator, other machineries and vehicles	Medium	-ve, T
		Biological	Loss of vegetation	Medium	-ve, P
		Socio- economic	Occupational health and safety impacts for workers	Medium	-ve, P
		Solid Waste management	Unscientific disposal of debris / solid waste	Medium	-ve, P
C.1.2.	Setting up of	Land	Loss of soil productivity	Medium	-ve, T
	labour camp	Water	Pollution of water bodies with sewage	Medium	-ve, T
		Air	No impact	-	-
		Noise	No impact	-	-
		Biological	Loss of vegetation	Minor	-ve, T
			Deforestation	Minor	-ve, T
		Socio- economic	Health impact due to fire accidents, Increase in communicable diseases	Medium	-ve, P
		Solid Waste management	Unhygienic environment due to unsafe disposal of waste generated.	Minor	-ve, T

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
C.1.3.	Setting up of	Land	Loss of top soil	Major	-ve, P
	Quarry and Crusher	Water	Surface water pollution due to run off with sediments from the site	Medium	-ve, T
	Crusher	Air	Air pollution due to fugitive dust and emissions from diesel generator	Major	-ve, T
		Noise	Noise pollution due to Crusher	Major	-ve, T
		Biological	Loss of vegetation	Medium	-ve, P
		Socio- economic	Occupational health and safety impacts for workers, Risk for local inhabitants and passengers through nearby roads, railways, ropeways and waterways.	Medium	-ve, P
		Solid Waste Management	No impact	-	-
C.1.4.	Setting up of	Land	Loss of topsoil, soil erosion	Major	-ve, P
	borrow area	Water	Pollution of water bodies due to surface run off.	Medium	-ve, T
		Air	Air pollution due to fugitive dust.	Medium	-ve, T
		Noise	No impact	-	-
		Biological	Loss of trees	Medium	-ve, P
		Socio- economic	Risk for local inhabitants due to trespassing	Medium	-ve, T
		Solid Waste Management	No impact	-	-
C.1.5.	Preparation	Land	Loss of productive land, erosion of disposed soil	Major	-ve, P
	of debris disposal site	Water	Surface water pollution due to run off from the site	Minor	-ve, T
	uisposai site	Air	No impact	-	-
		Noise	No impact	-	-

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
		Biological	Loss of trees	Minor	-ve, P
		Socio- economic	Risk for local inhabitants due to trespassing	Minor	-ve, T
		Solid waste management	No impact	-	-
C.1.6.	Clearing,	Land	Destabilization of slopes, soil erosion.	Medium	-ve, T /P ?
	Grubbing and Stripping	Water	No impact	-	-
	Supplig	Air	Change in micro climate	Minor	-ve, T
		Noise	Increase in noise levels	Minor	-ve, T
		Biological	Loss of vegetative cover and impact on fauna	Major	-ve, P
		Socio- economic	Loss of tree shade. Safety of pedestrians and passers by.	Minor	-ve, T
		Solid waste management	Unscientific / unsafe disposal of tree waste	Minor	-ve, T
C.1.7.	Cutting of	Land	Loss of topsoil, water logging due to alterations in natural drainage patterns.	Major	-ve, P
	Earth	Water	Blocking of cross drainage and water logging, contaminating water bodies	Major	-ve, P
		Air	Increased air pollution due to fugitive dust/ emissions.	Medium	-ve, T
		Noise	Increase in noise levels	Medium	-ve, T
		Biological	No impact	-	-
		Socio- economic	No impact	-	-
		Solid waste	Unscientific/ unsafe disposal of over burden	Medium	-ve, P

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
		management			
C.1.8.	Filling	Land	Loss of topsoil, alteration of natural drainage patterns.	Major	-ve, P
		Water	Diversion of natural surface water flows, alterations/blocking of cross drainage and water logging.	Medium	-ve, P
		Air	Increased air pollution due to fugitive dust / emissions.	Medium	-ve, T
		Noise	Increase in noise levels	Medium	-ve, T
		Biological	No impact	-	-
		Socio- economic	Flooding of adjacent low lying land	Medium	-ve, P
		Solid waste management	No impact	-	-
C.1.9.	Stripping	Land	Loss of topsoil, removal of vegetation.	Major	-ve, P
		Water	Pollution of water bodies due to irresponsible handling of stripped earth.	Medium	-ve, P
		Air	Increased air pollution	Major	-ve, T
		Noise	Increase in noise levels	Medium	-ve, T
		Biological	No impact	-	-
		Socio- economic	No impact	-	-
		Solid waste management	No impact	Medium	-ve, T
C.1.10.	Demolition	Land	No impact	-	-
		Water	No impact	-	-

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
		Air	Increased air pollution due to fugitive dust	Medium	-ve, T
		Noise	Increase in noise levels due to demolition activity	Medium	-ve, T
		Biological	No impact	-	-
		Socio- economic	No impact	-	-
		Solid waste management	Unscientific / unsafe disposal of debris	Medium	-ve, P
D.2.	Construction	Activities		1	
D.2.1.	Operation of construction camp	Land	Complete elimination of productive capacity of soil, spillage of fuel, lubricants and hazardous chemicals.	Medium	-ve, T
		Water	Surface water pollution due to run off and waste water / sewage disposal from the camps.	Medium	-ve, T
		Air	Increase in air pollution due to operation of machineries.	Medium	-ve, T
		Noise	Increase in noise level due to operation of machineries.	-	-
		Biological	Loss of vegetation	-	-
		Socio-	Occupational health and safety impacts for workers	Major	-ve, P
		economic		Major	-ve, P
		Solid waste management	Unscientific / unsafe disposal of debris / waste	Major	-ve, P
D.2.2.	Functioning	Land	Contamination of soil due to waste water	Medium	-ve, T
	of labour	Water	Surface water pollution due to run off from the site	Medium	-ve, T
	camp	Air	Air pollution due to burning of dry waste/ fire wood.	Minor	-ve, T

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
		Noise	No impact.	-	-
		Biological	Loss of trees, Impact on forests, spread of forest fire	Minor	-ve, T
		Socio- economic	Increase in communicable diseases Increase in crime rate Indulgence in hunting and collection of forest produces.	Medium	-ve, T
			Collection of firewood if camp is near the forest Chances of forest fires	Medium	-ve, T
			Occurrence of accidents	Medium	-ve, T
		Solid waste management	Unhygienic environment due to unsafe disposal of solid waste generated.	Minor	-ve, T
D.2.3.	Quarrying	Land	Loss of soil productivity, soil contamination	Major	-ve, P
	and operation of crushers	Water	Surface water pollution due to run off from the site	Medium	-ve, P
	or erusiters	Air	Air pollution due to fugitive dust.	Medium	-ve, T
		Noise	Noise pollution due to stone blasting	Medium	-ve, T
		Biological	No impact	-	-
		Socio- economic	Safety of labourers	Medium	-ve, P
		Solid waste management	No impact	-	-
D.2.4.	Borrowing of earth	Land	Loss of fertile lands, loss of topsoil, soil contamination, removal of vegetation, soil erosion, destabilization of slopes due to modification of natural conditions.	Major	-ve, P
		Water	Alterations in local drainage pattern, diversion of natural surface water flows,	Medium	-ve, P

Sl. No.	Activity	Environmen tal Attribute	Potential Impact	Degree of impact (Major/Medi um/Minor)	Nature of impact (+ve/-ve, T/P)
			blocking of cross drainage and water logging.		
		Air	Increased air pollution due to fugitive dust	Medium	-ve, T
